Why massive stars are important?

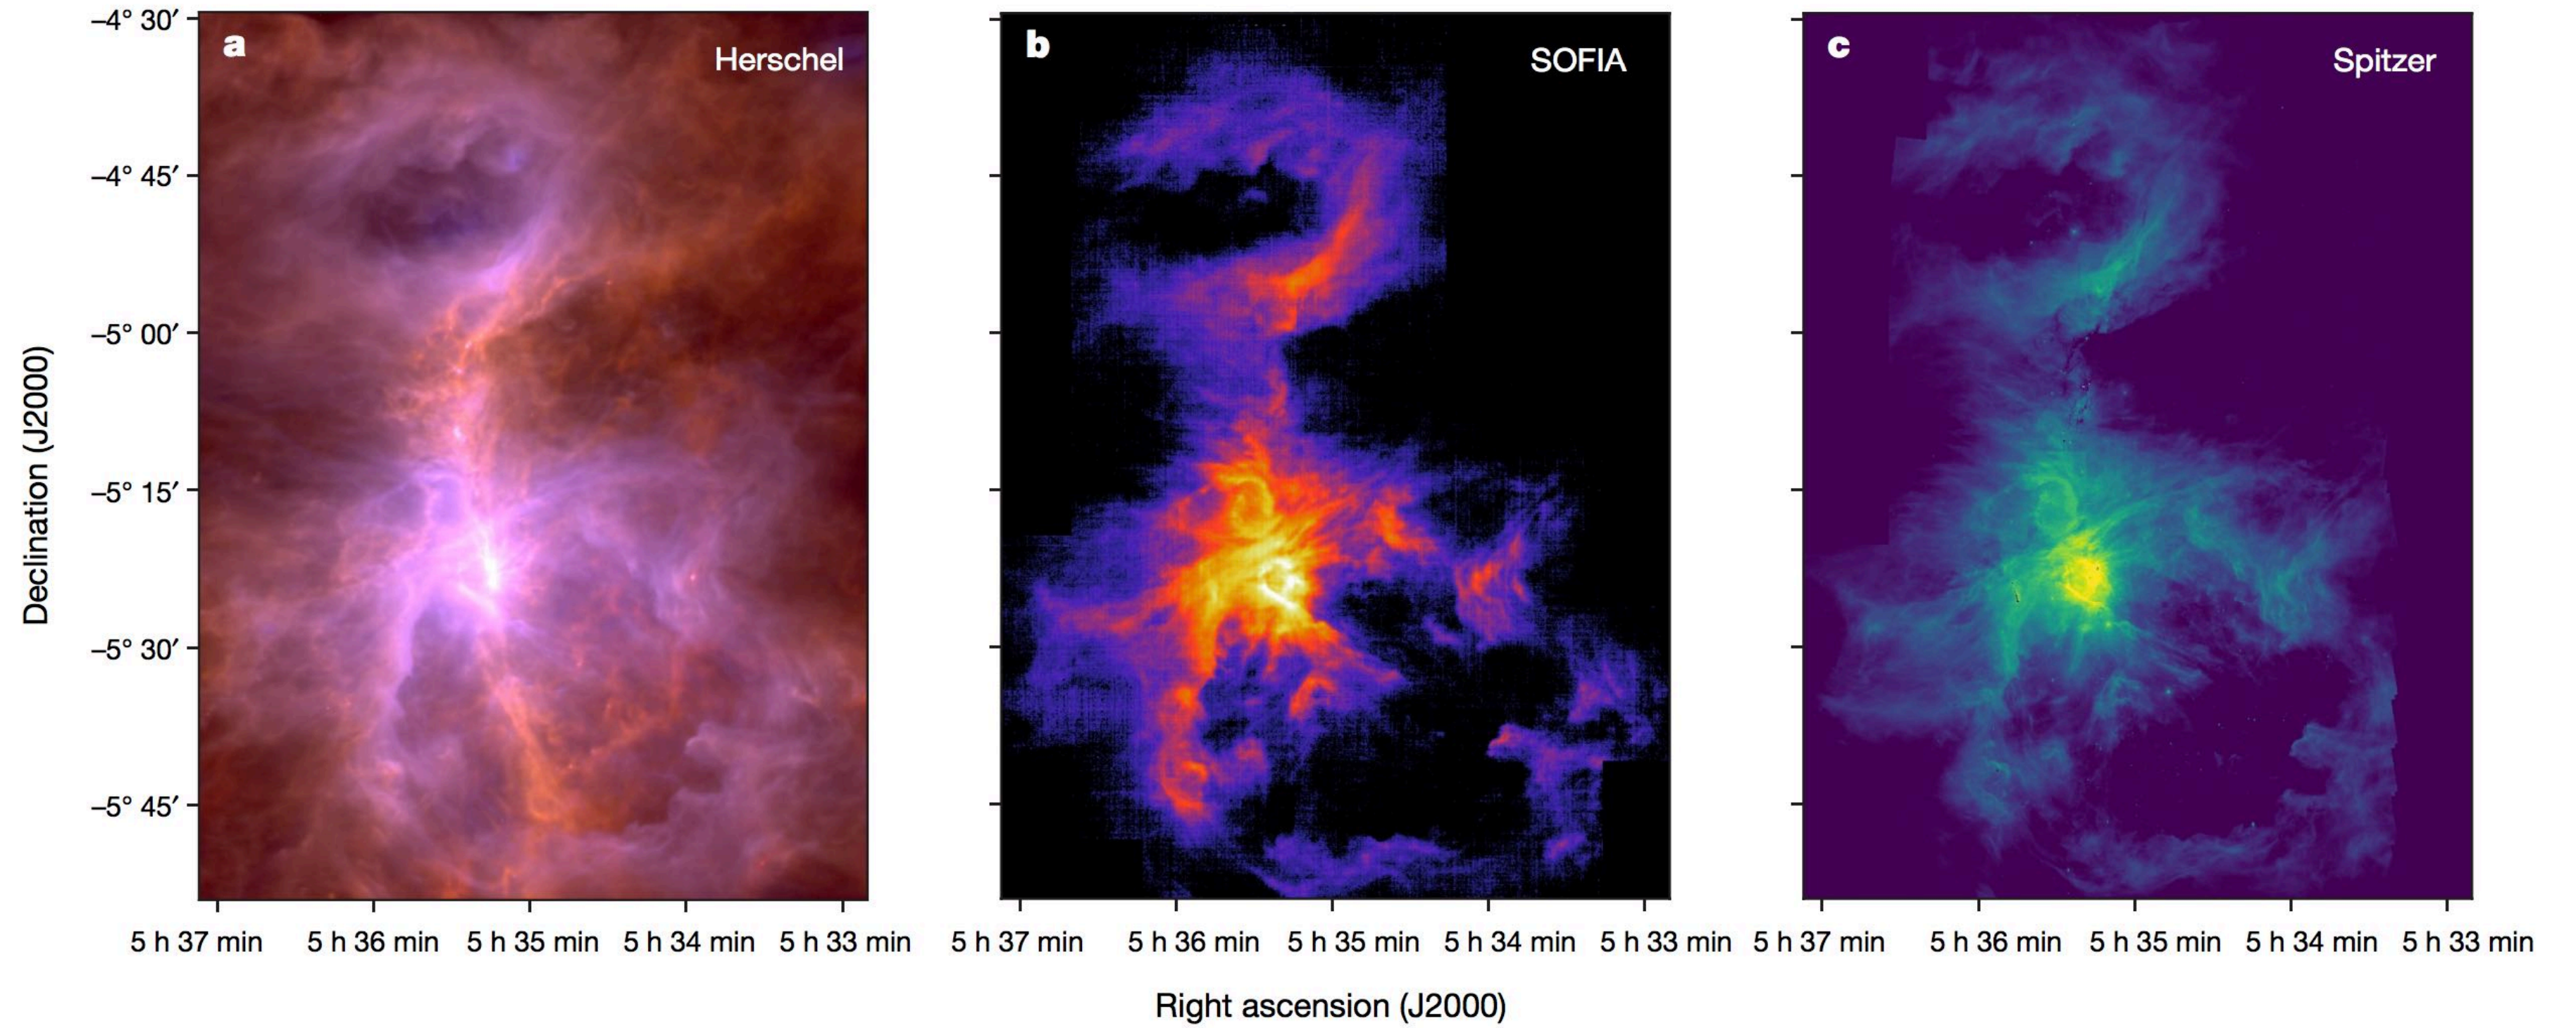

Reason #1 - Chemical Input

Astronomical Image Credits: ESA/NASA/AASNova

Graphic created by Jennifer Johnson

Why massive stars are important?

Reason #2 - Energetic feedbacks

The enormous massive star feedback can be a critical source to form and maintain the shapes of the environmental GMCs!

**Why
massive
stars are
important?**

**Reason #3
- Seeds of
SMBHs**

Evolutionary sequence of Massive stars and star clusters

(Beuther et al. 2007)

Cores to stars

- High-mass starless cores (HMSCs)
- High-mass cores harboring accreting low/intermediate mass protostar(s) destined to become a high-mass star(s)
- High-mass protostellar objects (HMPOs)
- Final stars

Clumps to clusters

- Massive starless clumps
- Protoclusters
- Stellar clusters

Two simple stages

- Infrared Quiescent (Infrared Dark Clouds)
- Infrared Bright (GHII regions)

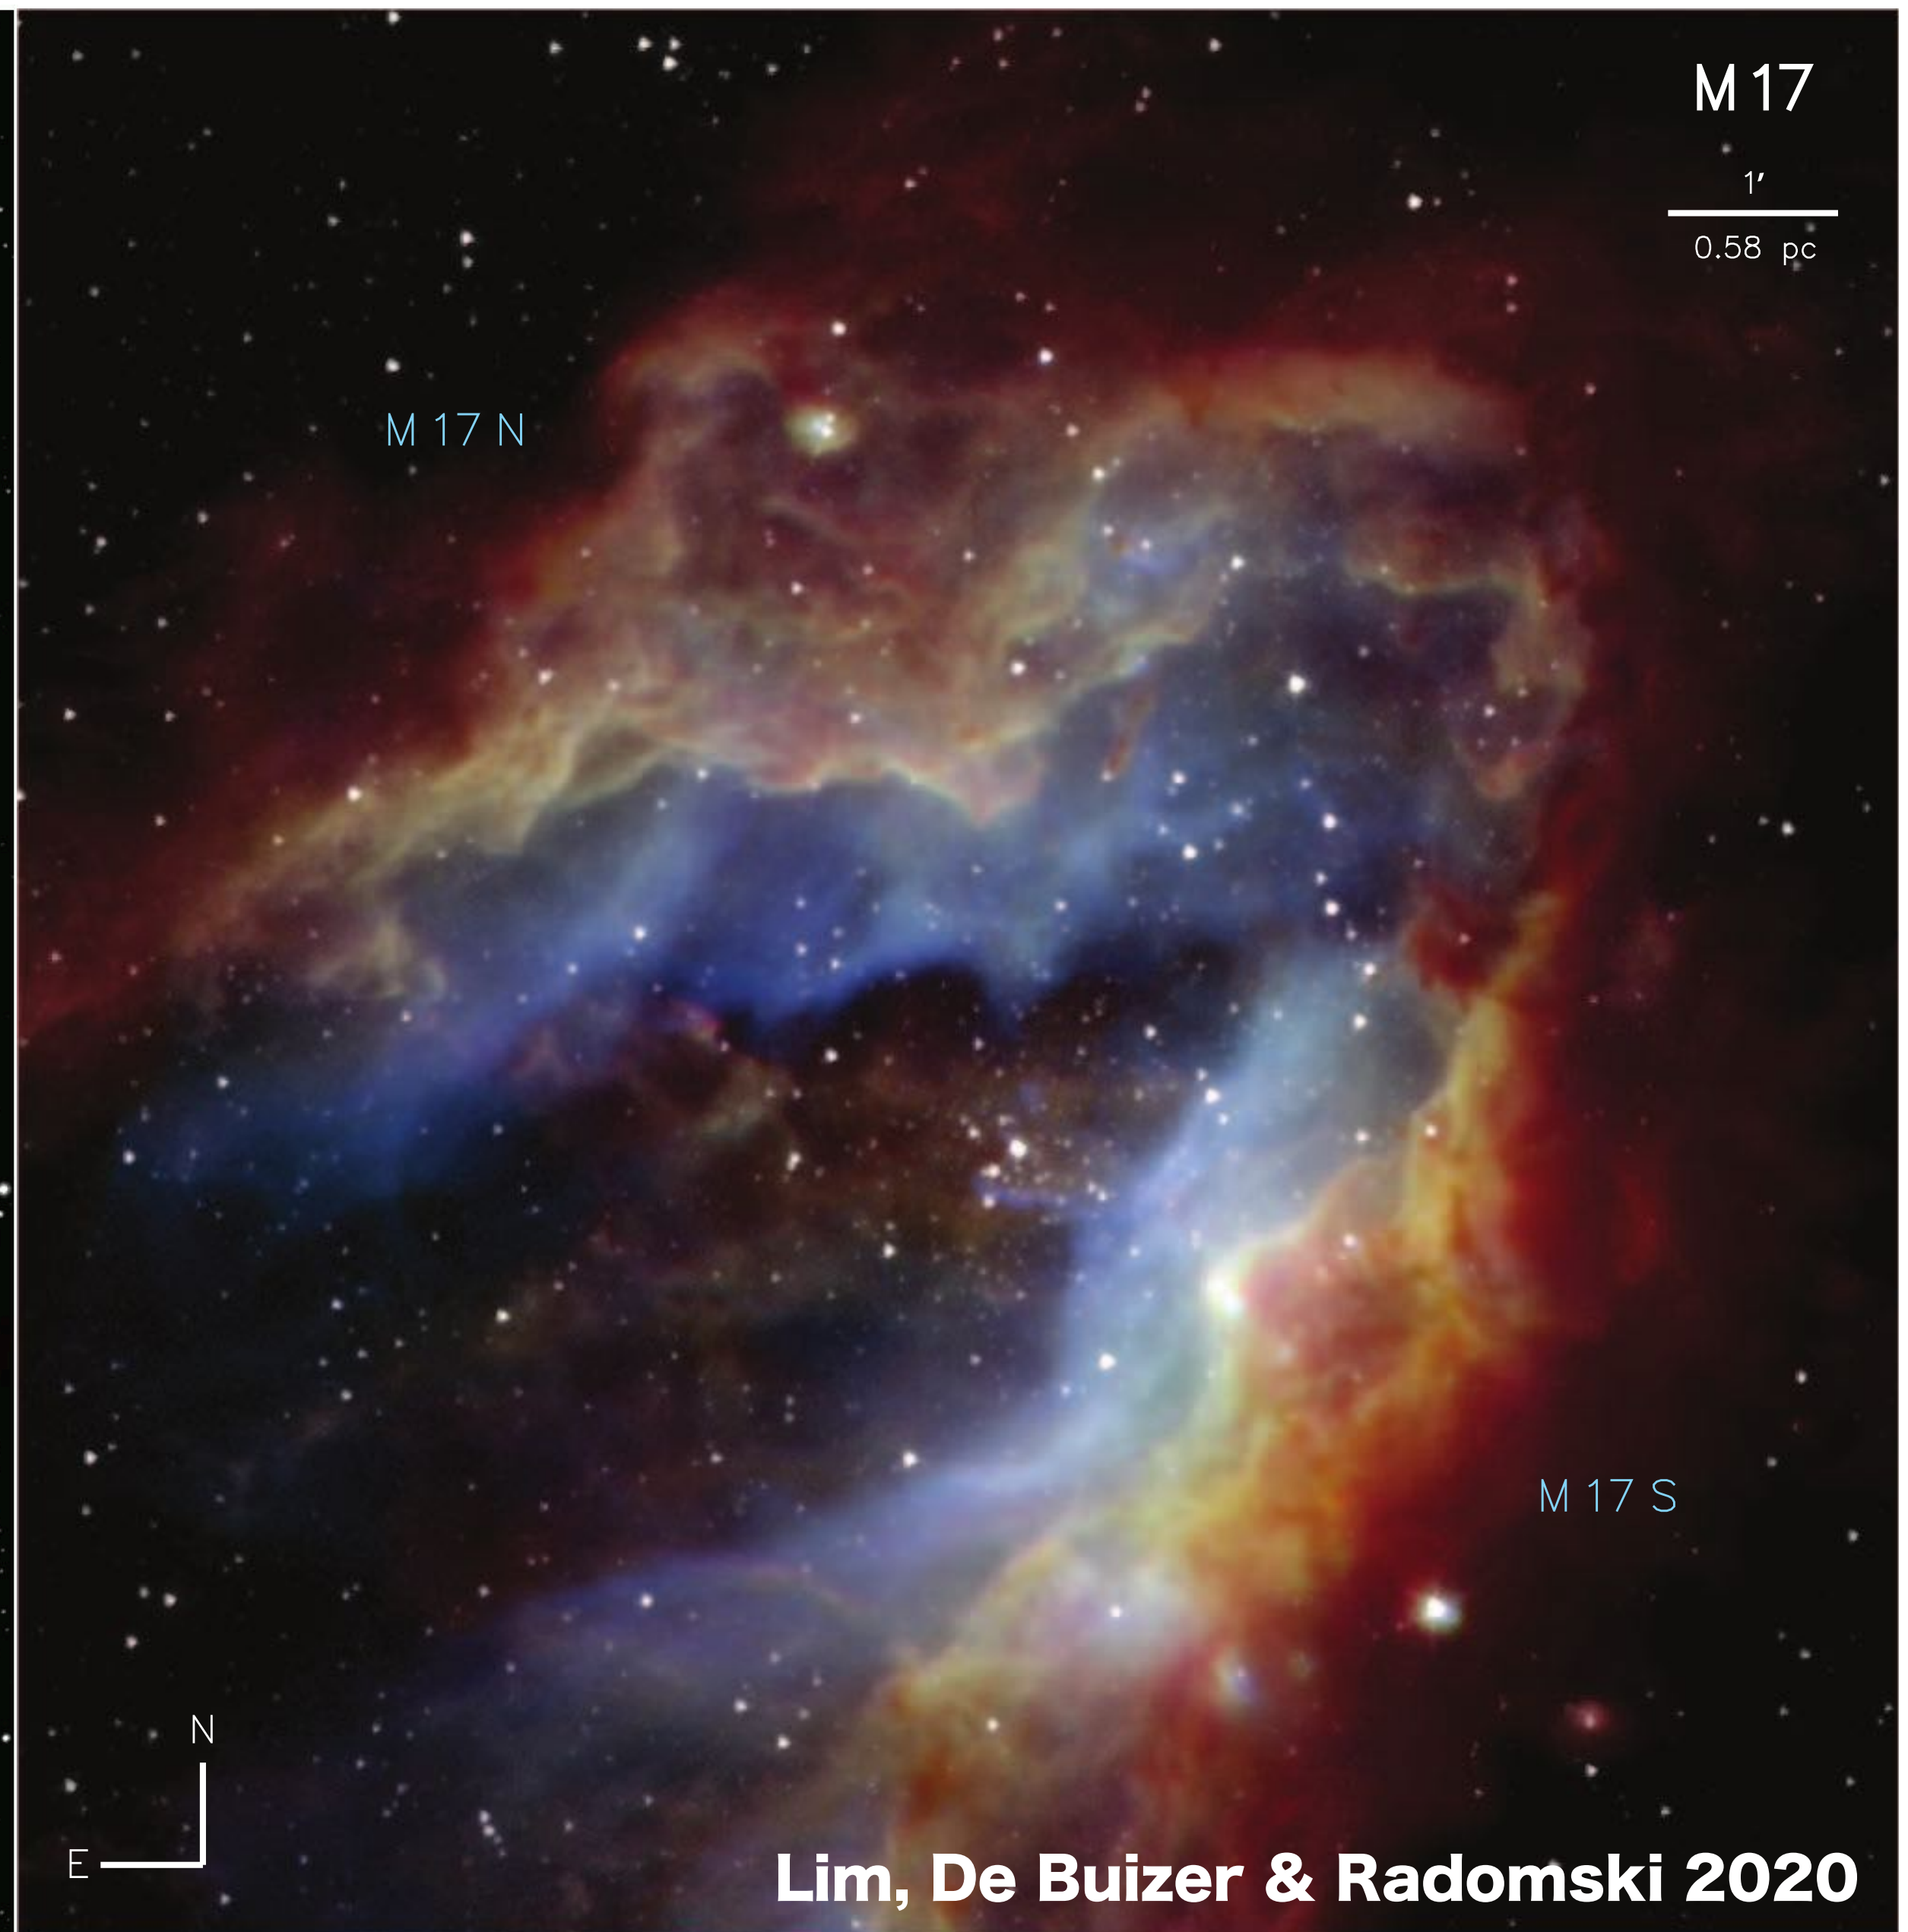

Giant HII (GHII) regions are...

- well known active massive star forming regions.
- bright across almost all wavelengths.
- only IR bright objects you can recognize easily from external galaxies.

Thus, it is important to study Galactic GHII regions to understand star formation even in external galaxies.

6

- W51A : one of the most massive Galactic GHII regions (Lim & De Buizer 2019)
- M17 : one of the closest GHII regions in from Sun (Lim, De Buizer & Radomski 2020)

D~5.4kpc **Blue - 20 μ m, Green - 37 μ m, Red - 70 μ m, White - 3.6 μ m** **D~2kpc**

IRAS 25 μ m

MSX 21 μ m

Spitzer MIPS 24 μ m

SOFIA FORCAST 20 μ m

SOFIA FORCAST 37 μ m

Why we need SOFIA?

Angular resolutions of
Space/Airborne Telescopes

IRAS ~ 1x4 arcmin

MSX ~ 18 arcsec

Spitzer-MIPS ~ 6 arcsec

SOFIA-FORCAST ~ 3 arcsec

Result 1.

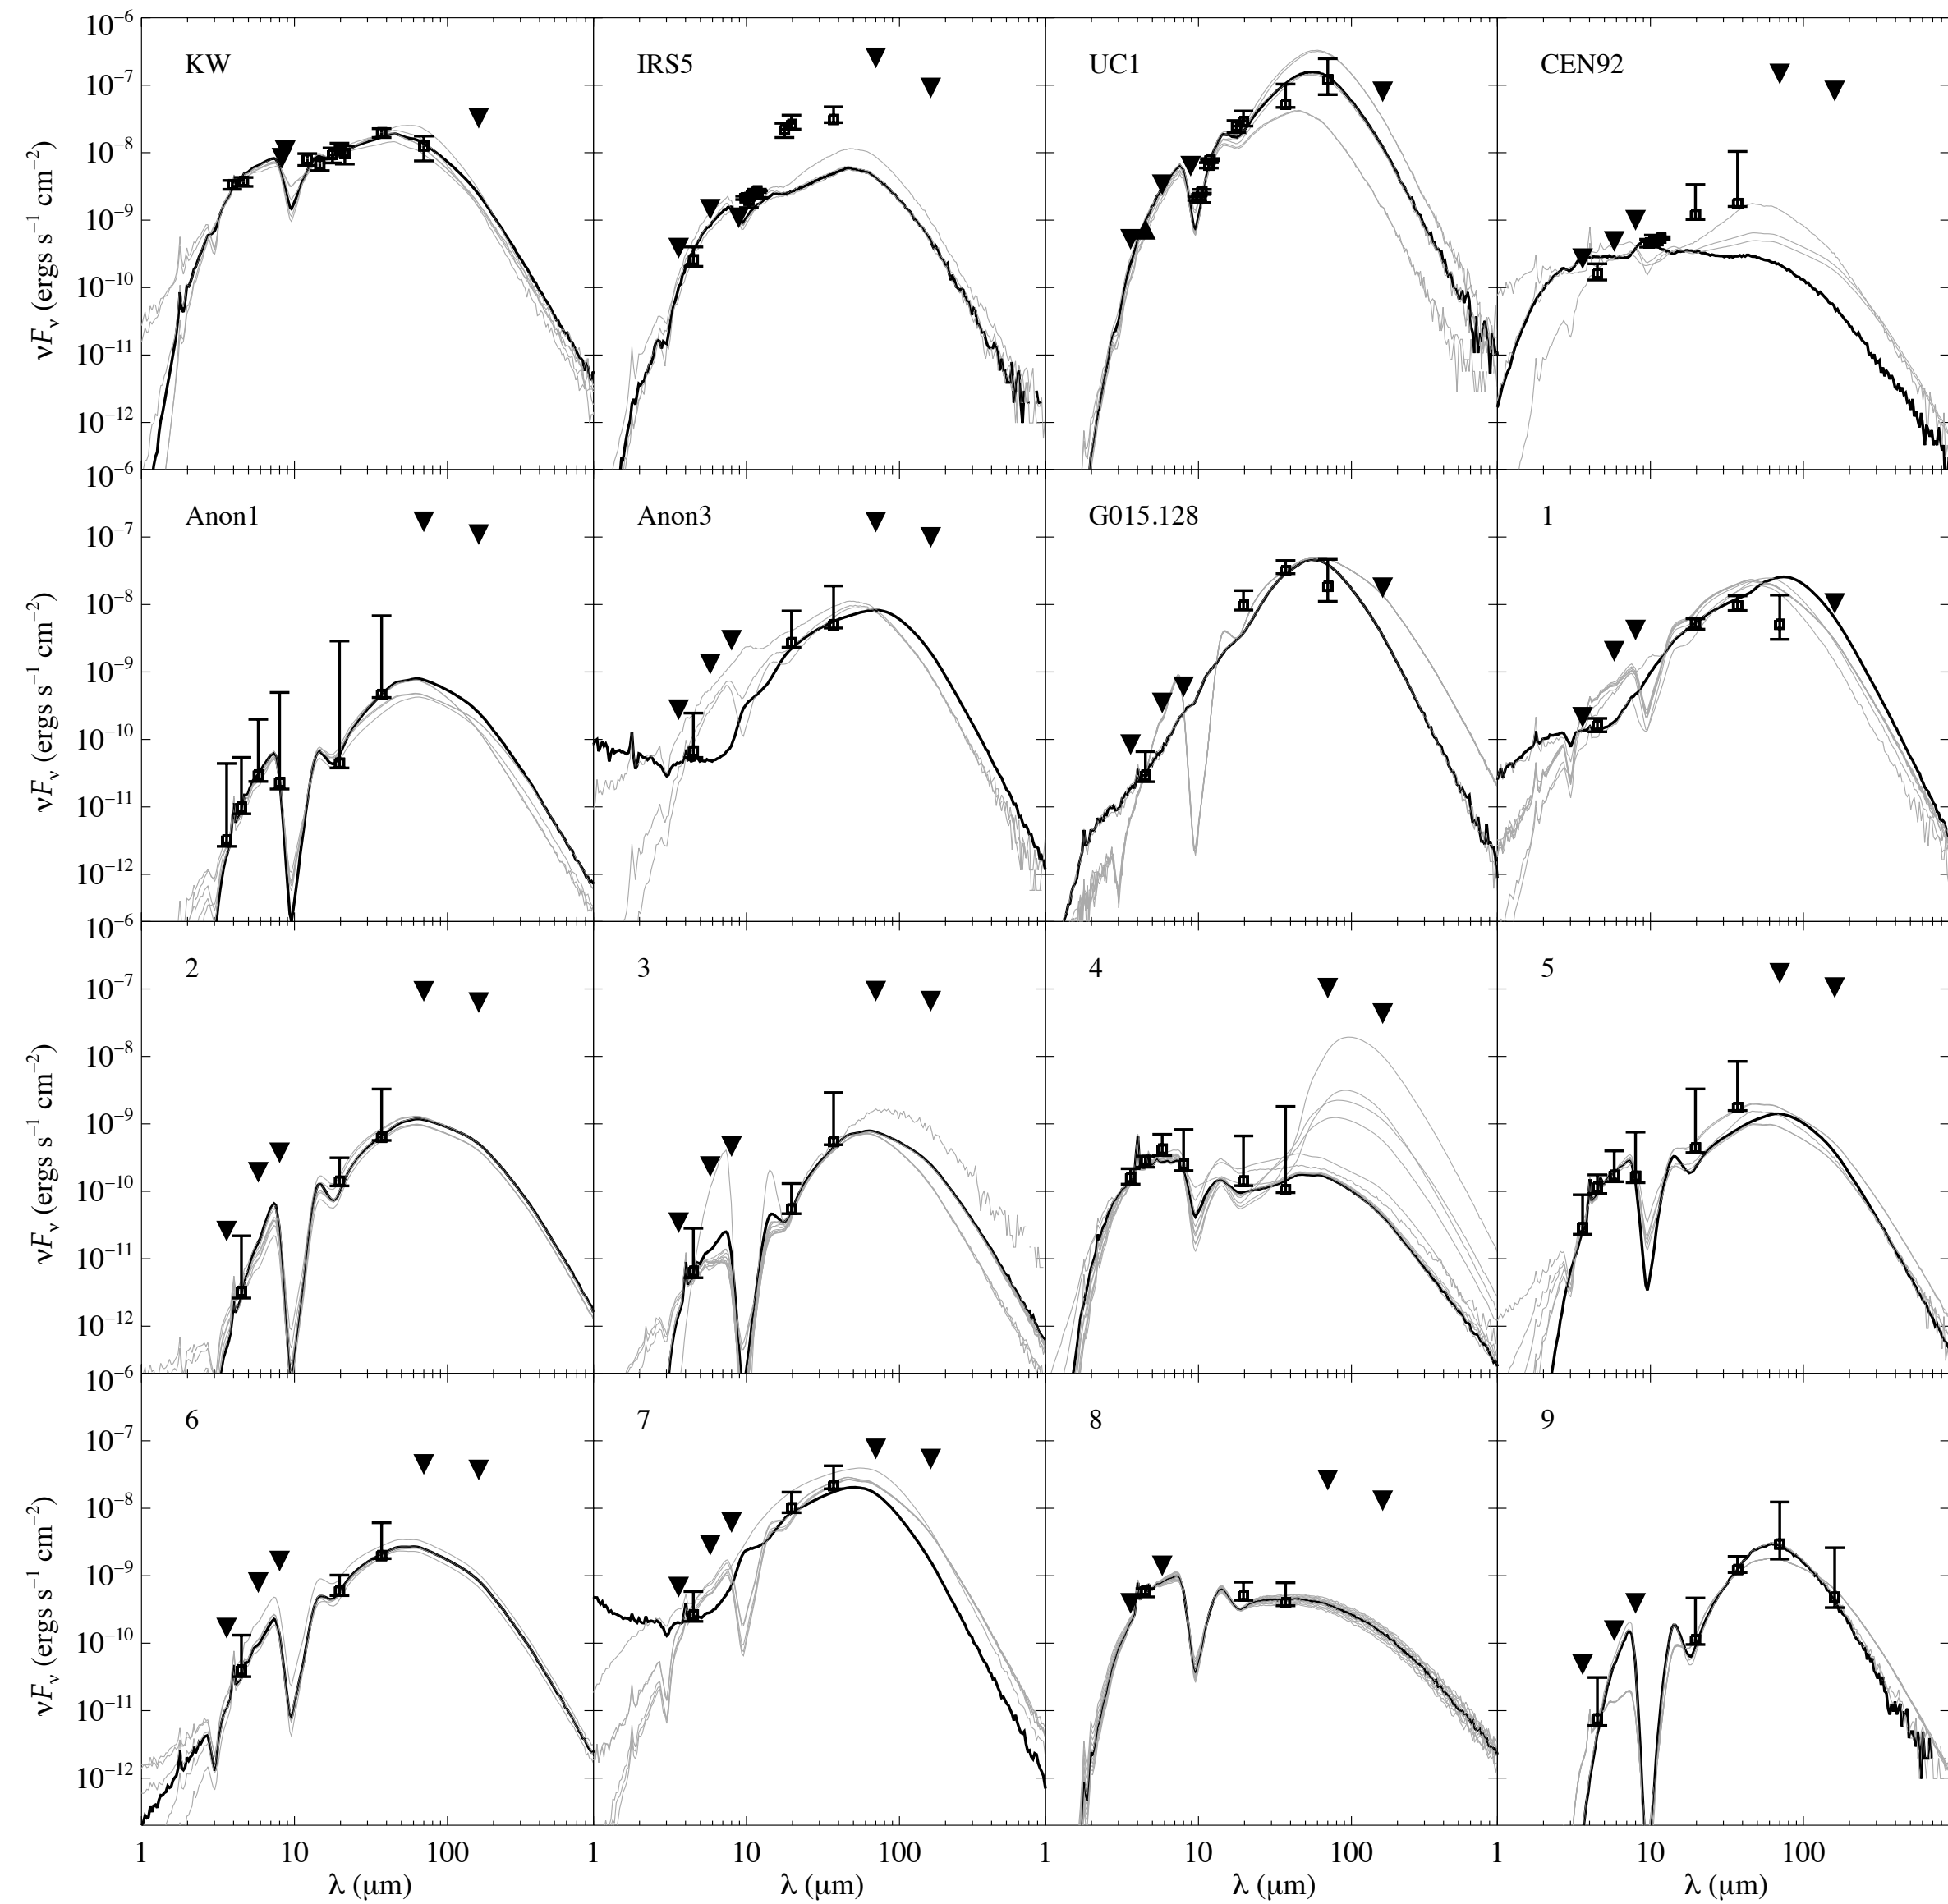

We have found an embedded population of MYSOs.

MYSO Candidates

Lim ea 2020

MYSO Candidates

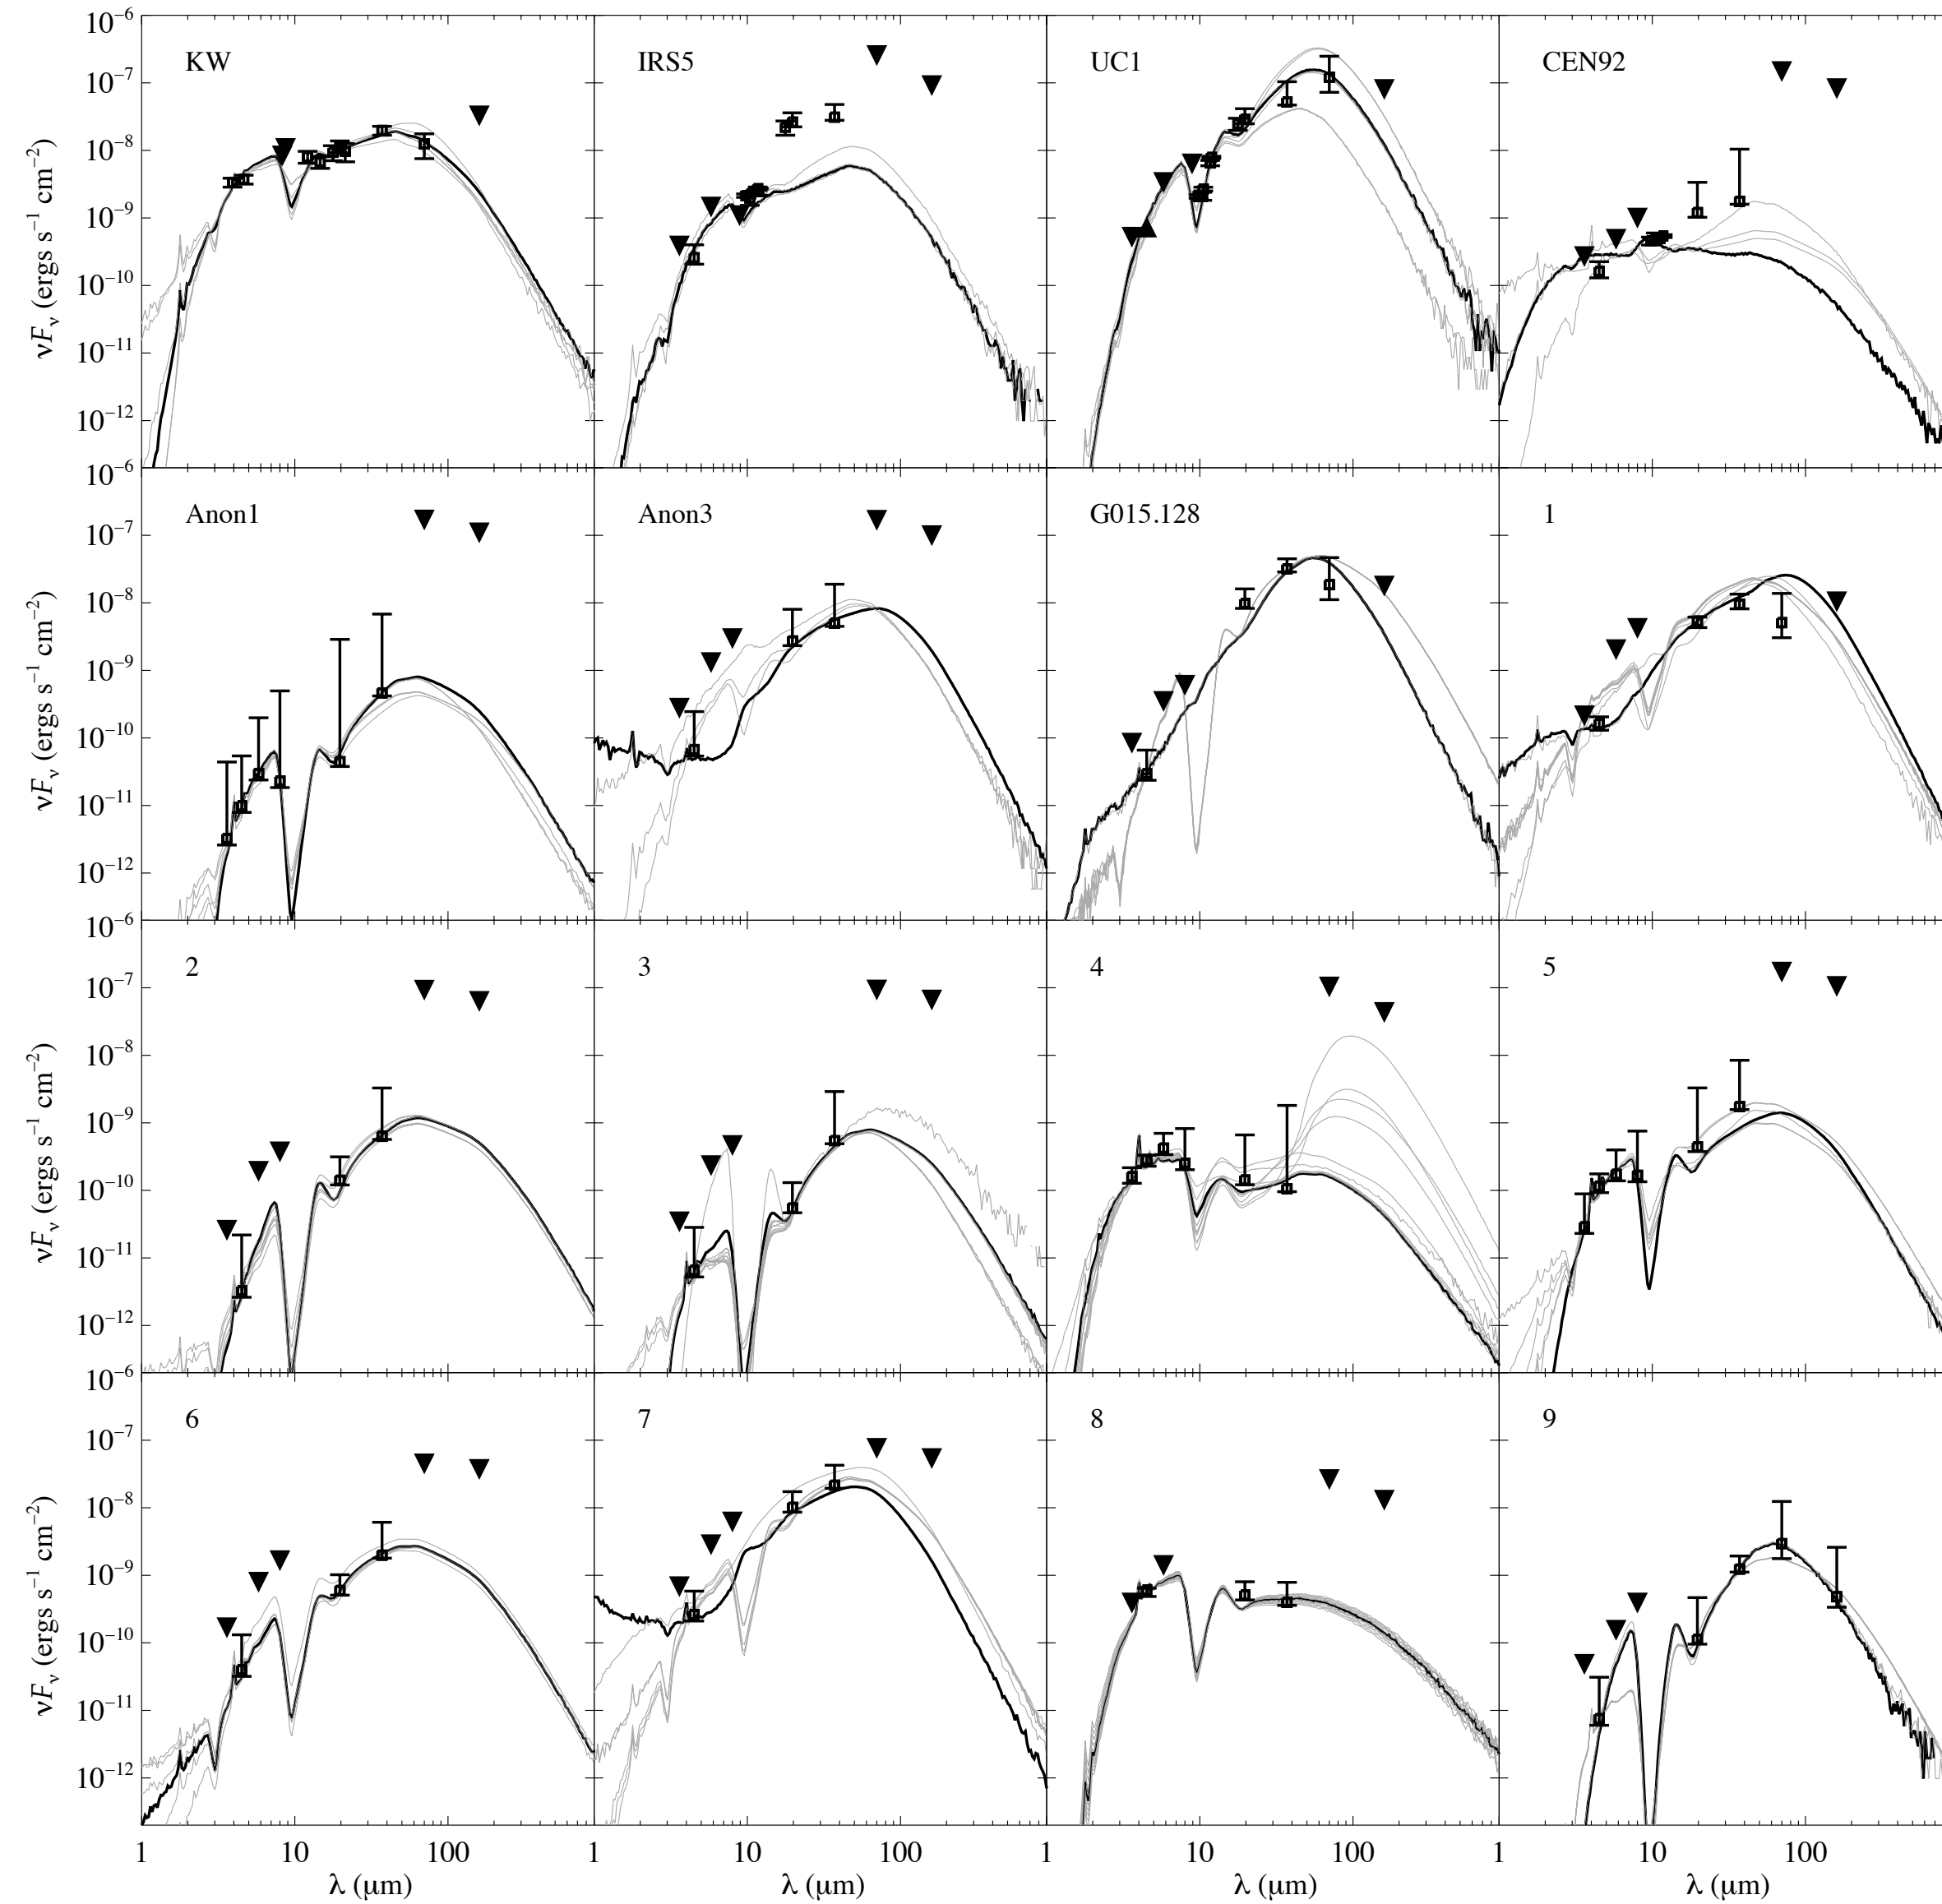

Lim ea 2020

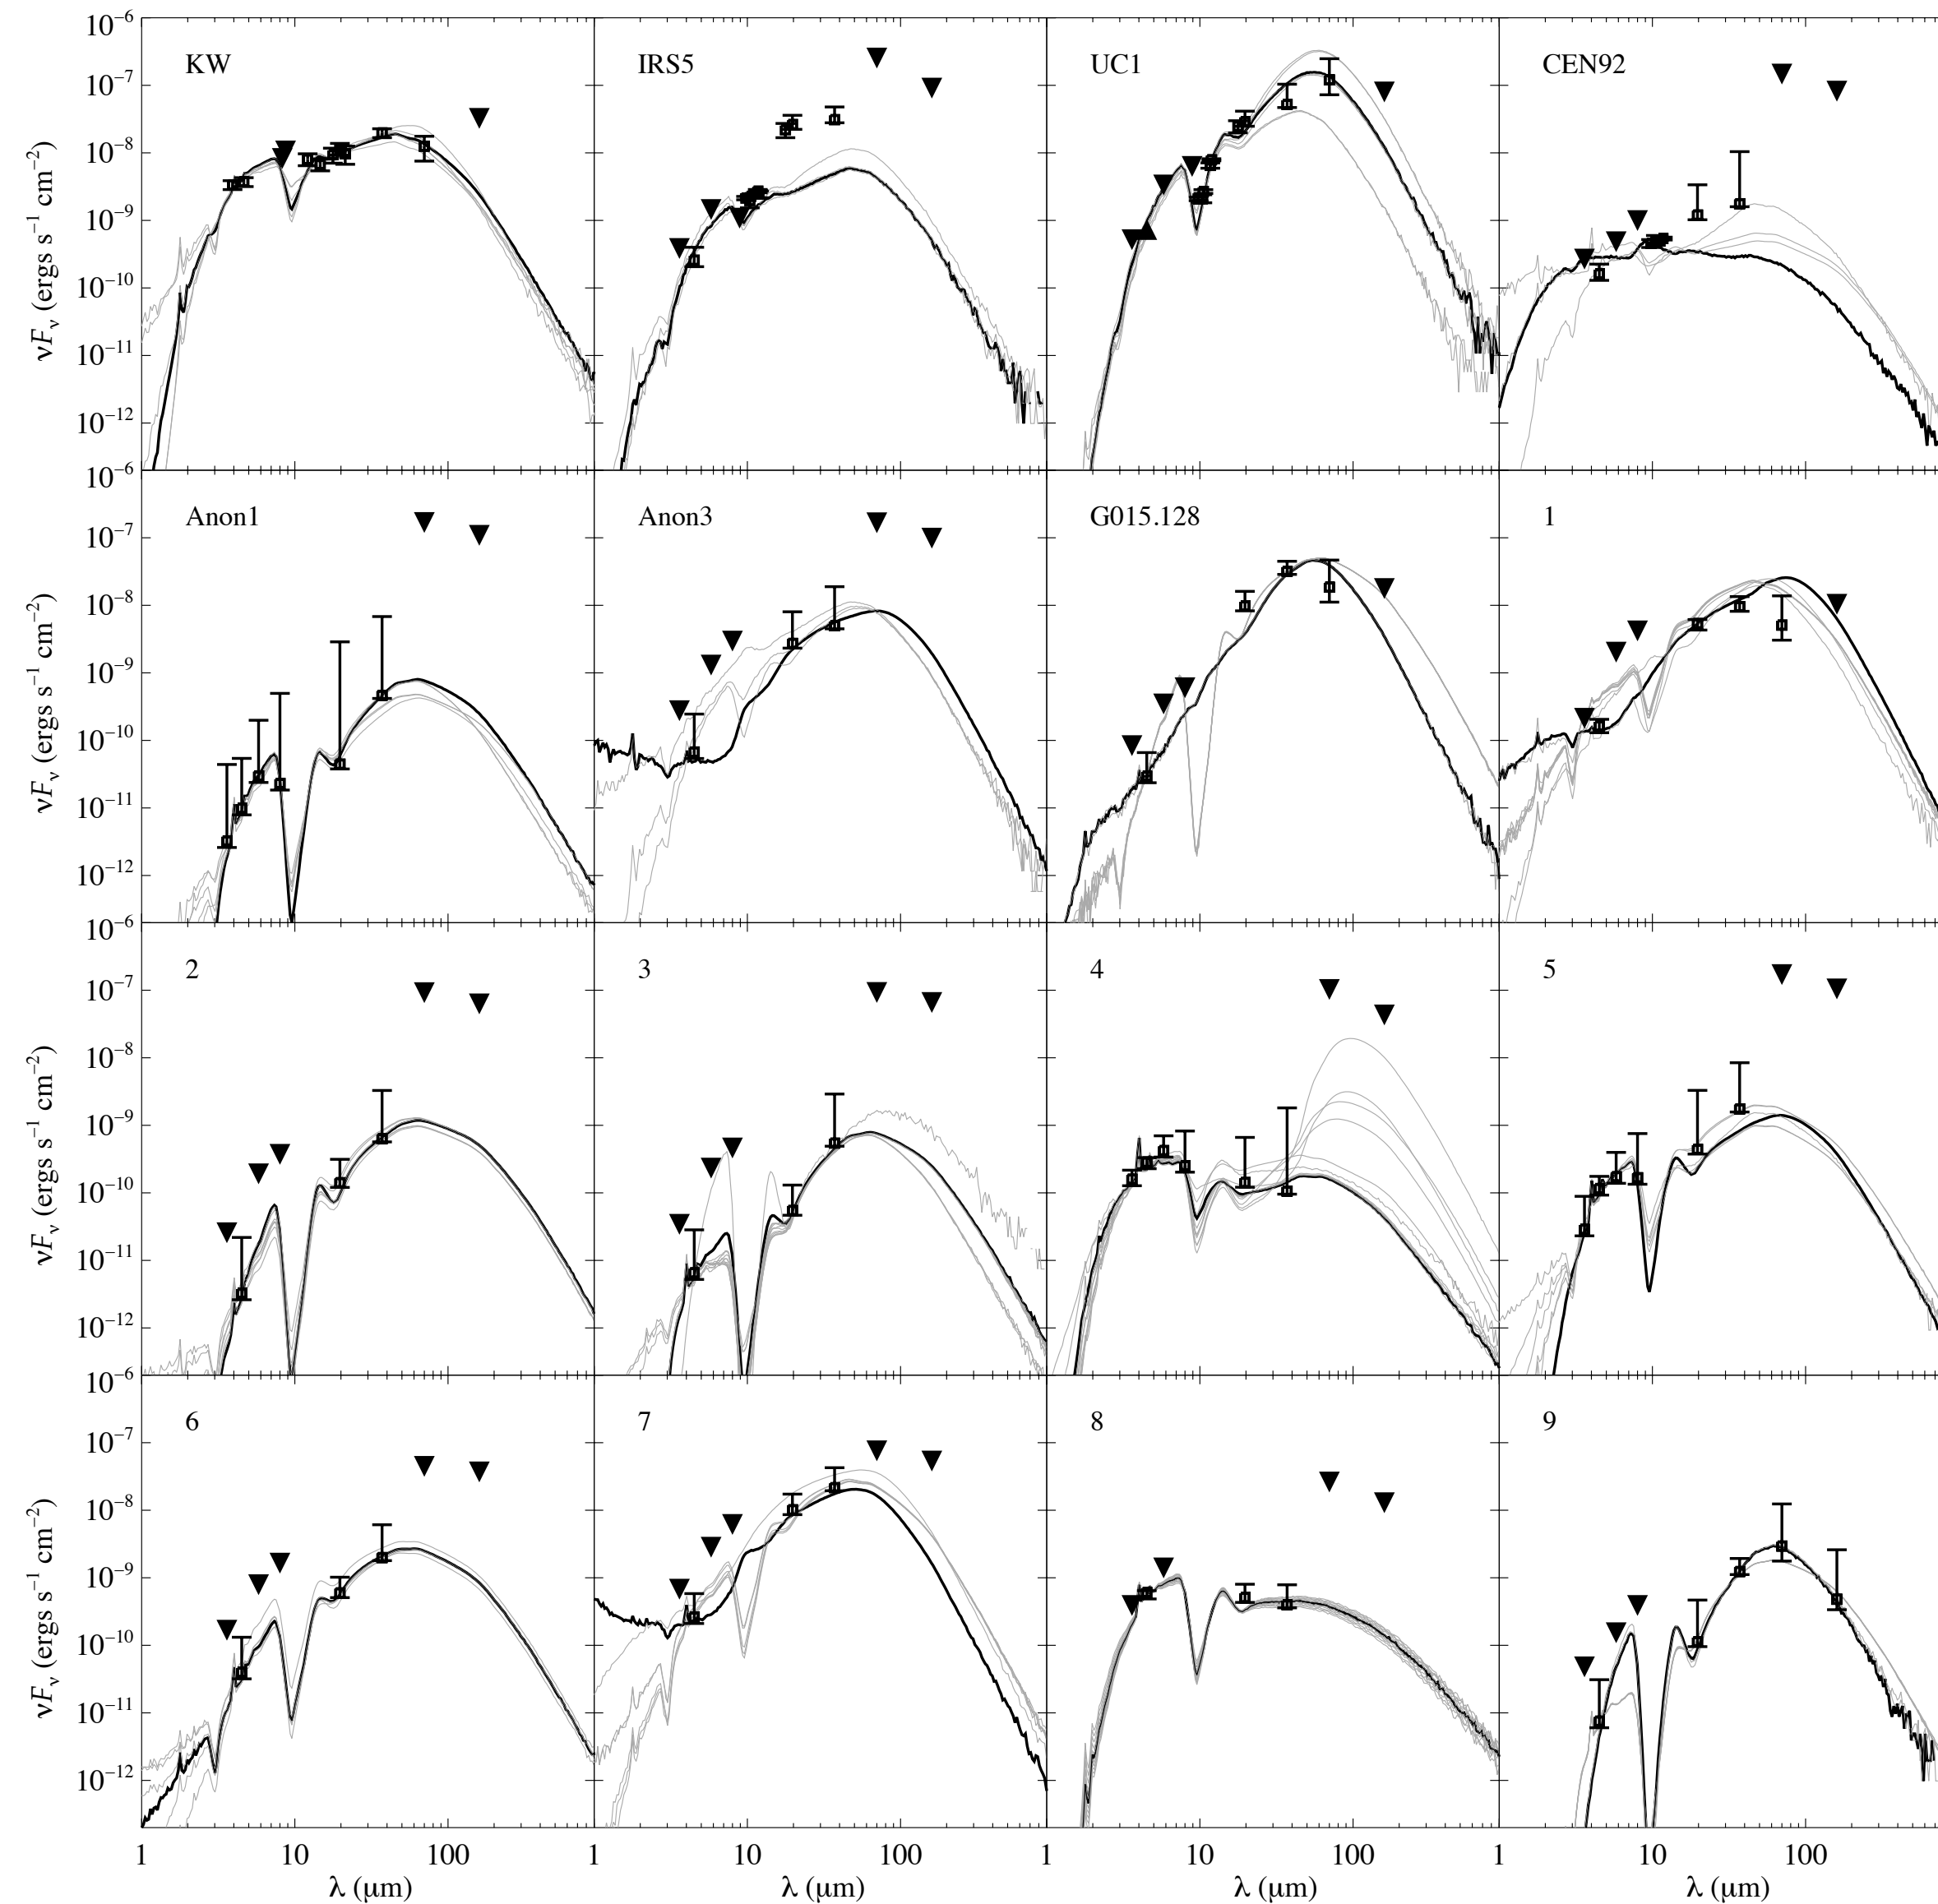

11

MYSO Candidates

MYSO Candidates

- 7 / 16 SOFIA sub-components and point sources are under MYSO criteria.
- 4 / 7 MYSO are first defined (suggested) in this study.
- Note that we found 41/47 MYSOs from W51A. The distance may matter.
- 20 & 37 μm data points are necessary to achieve the envelop SEDs.

Result 2.

**The entire M17 cloud does
not seem to be coeval.**

Proto-cluster Evolution

Virial analysis

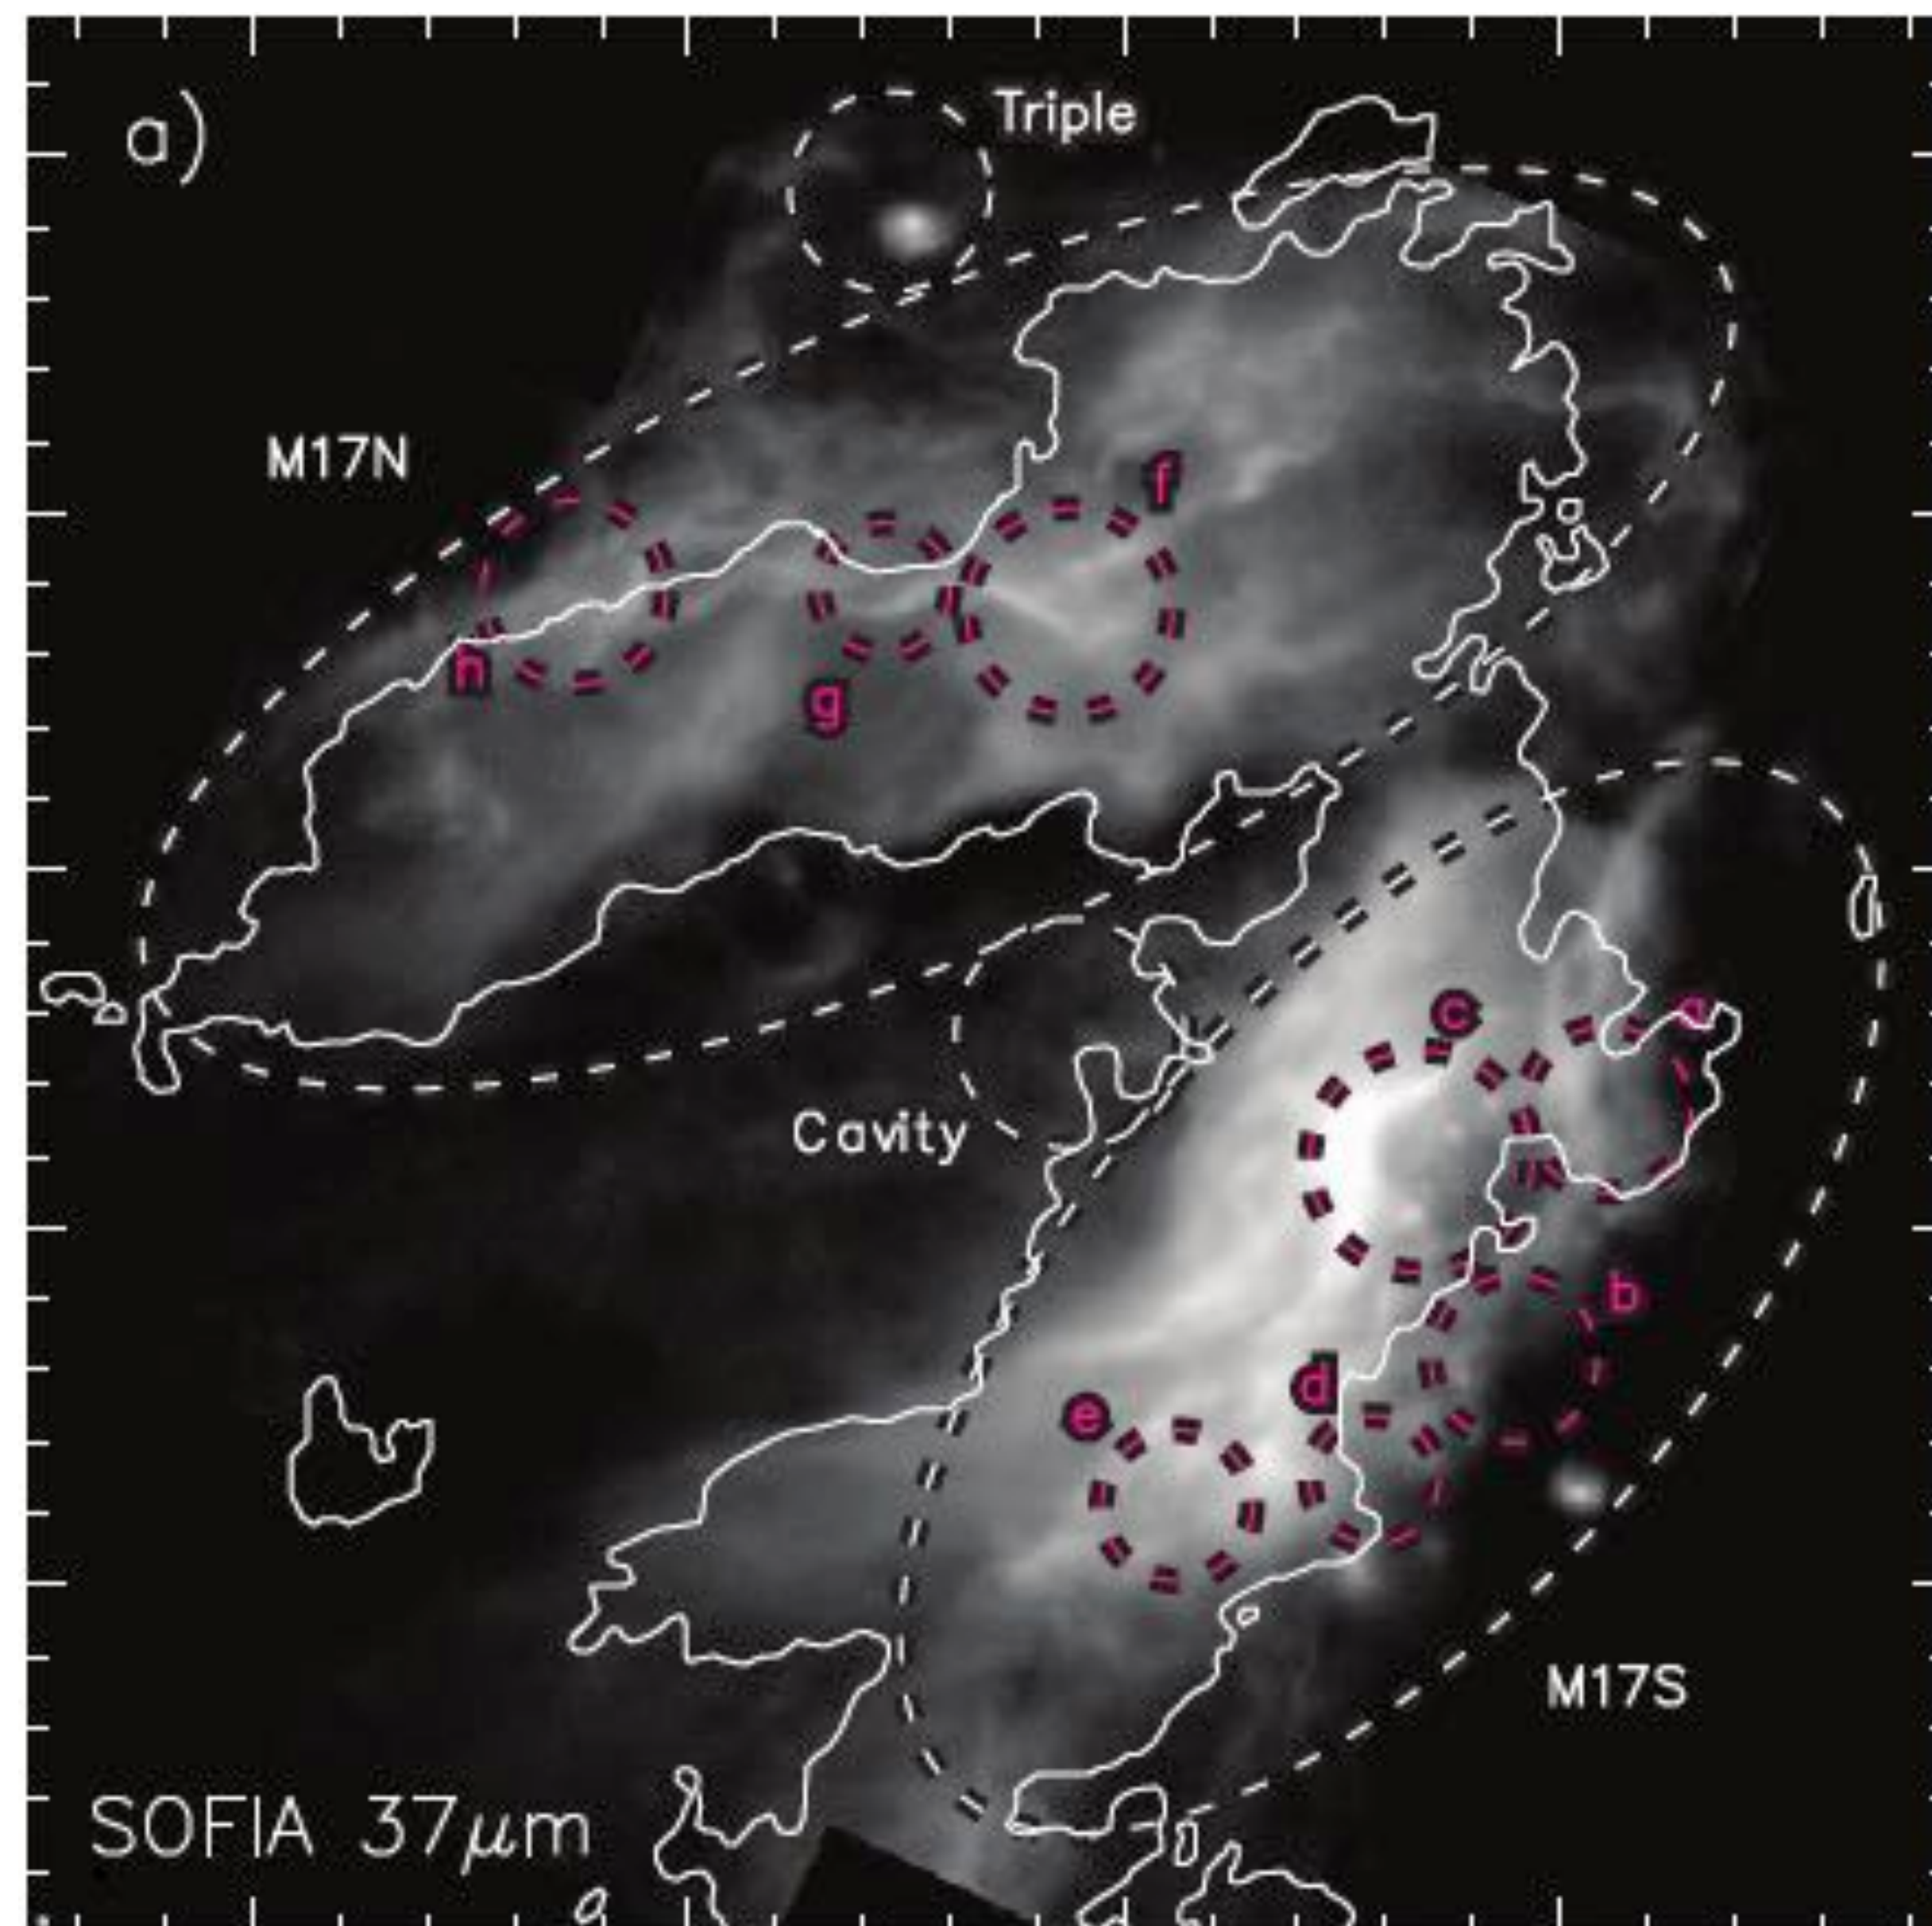

$$\alpha_{\text{vir}} = \frac{2T}{|W|} \approx \frac{5\sigma^2 R}{GM}$$

(Bertoldi & McKee 1992)

Higher α_{vir} may indicate the later clump evolutionary stages (i.e. more internal feedback makes higher kinetic energy).

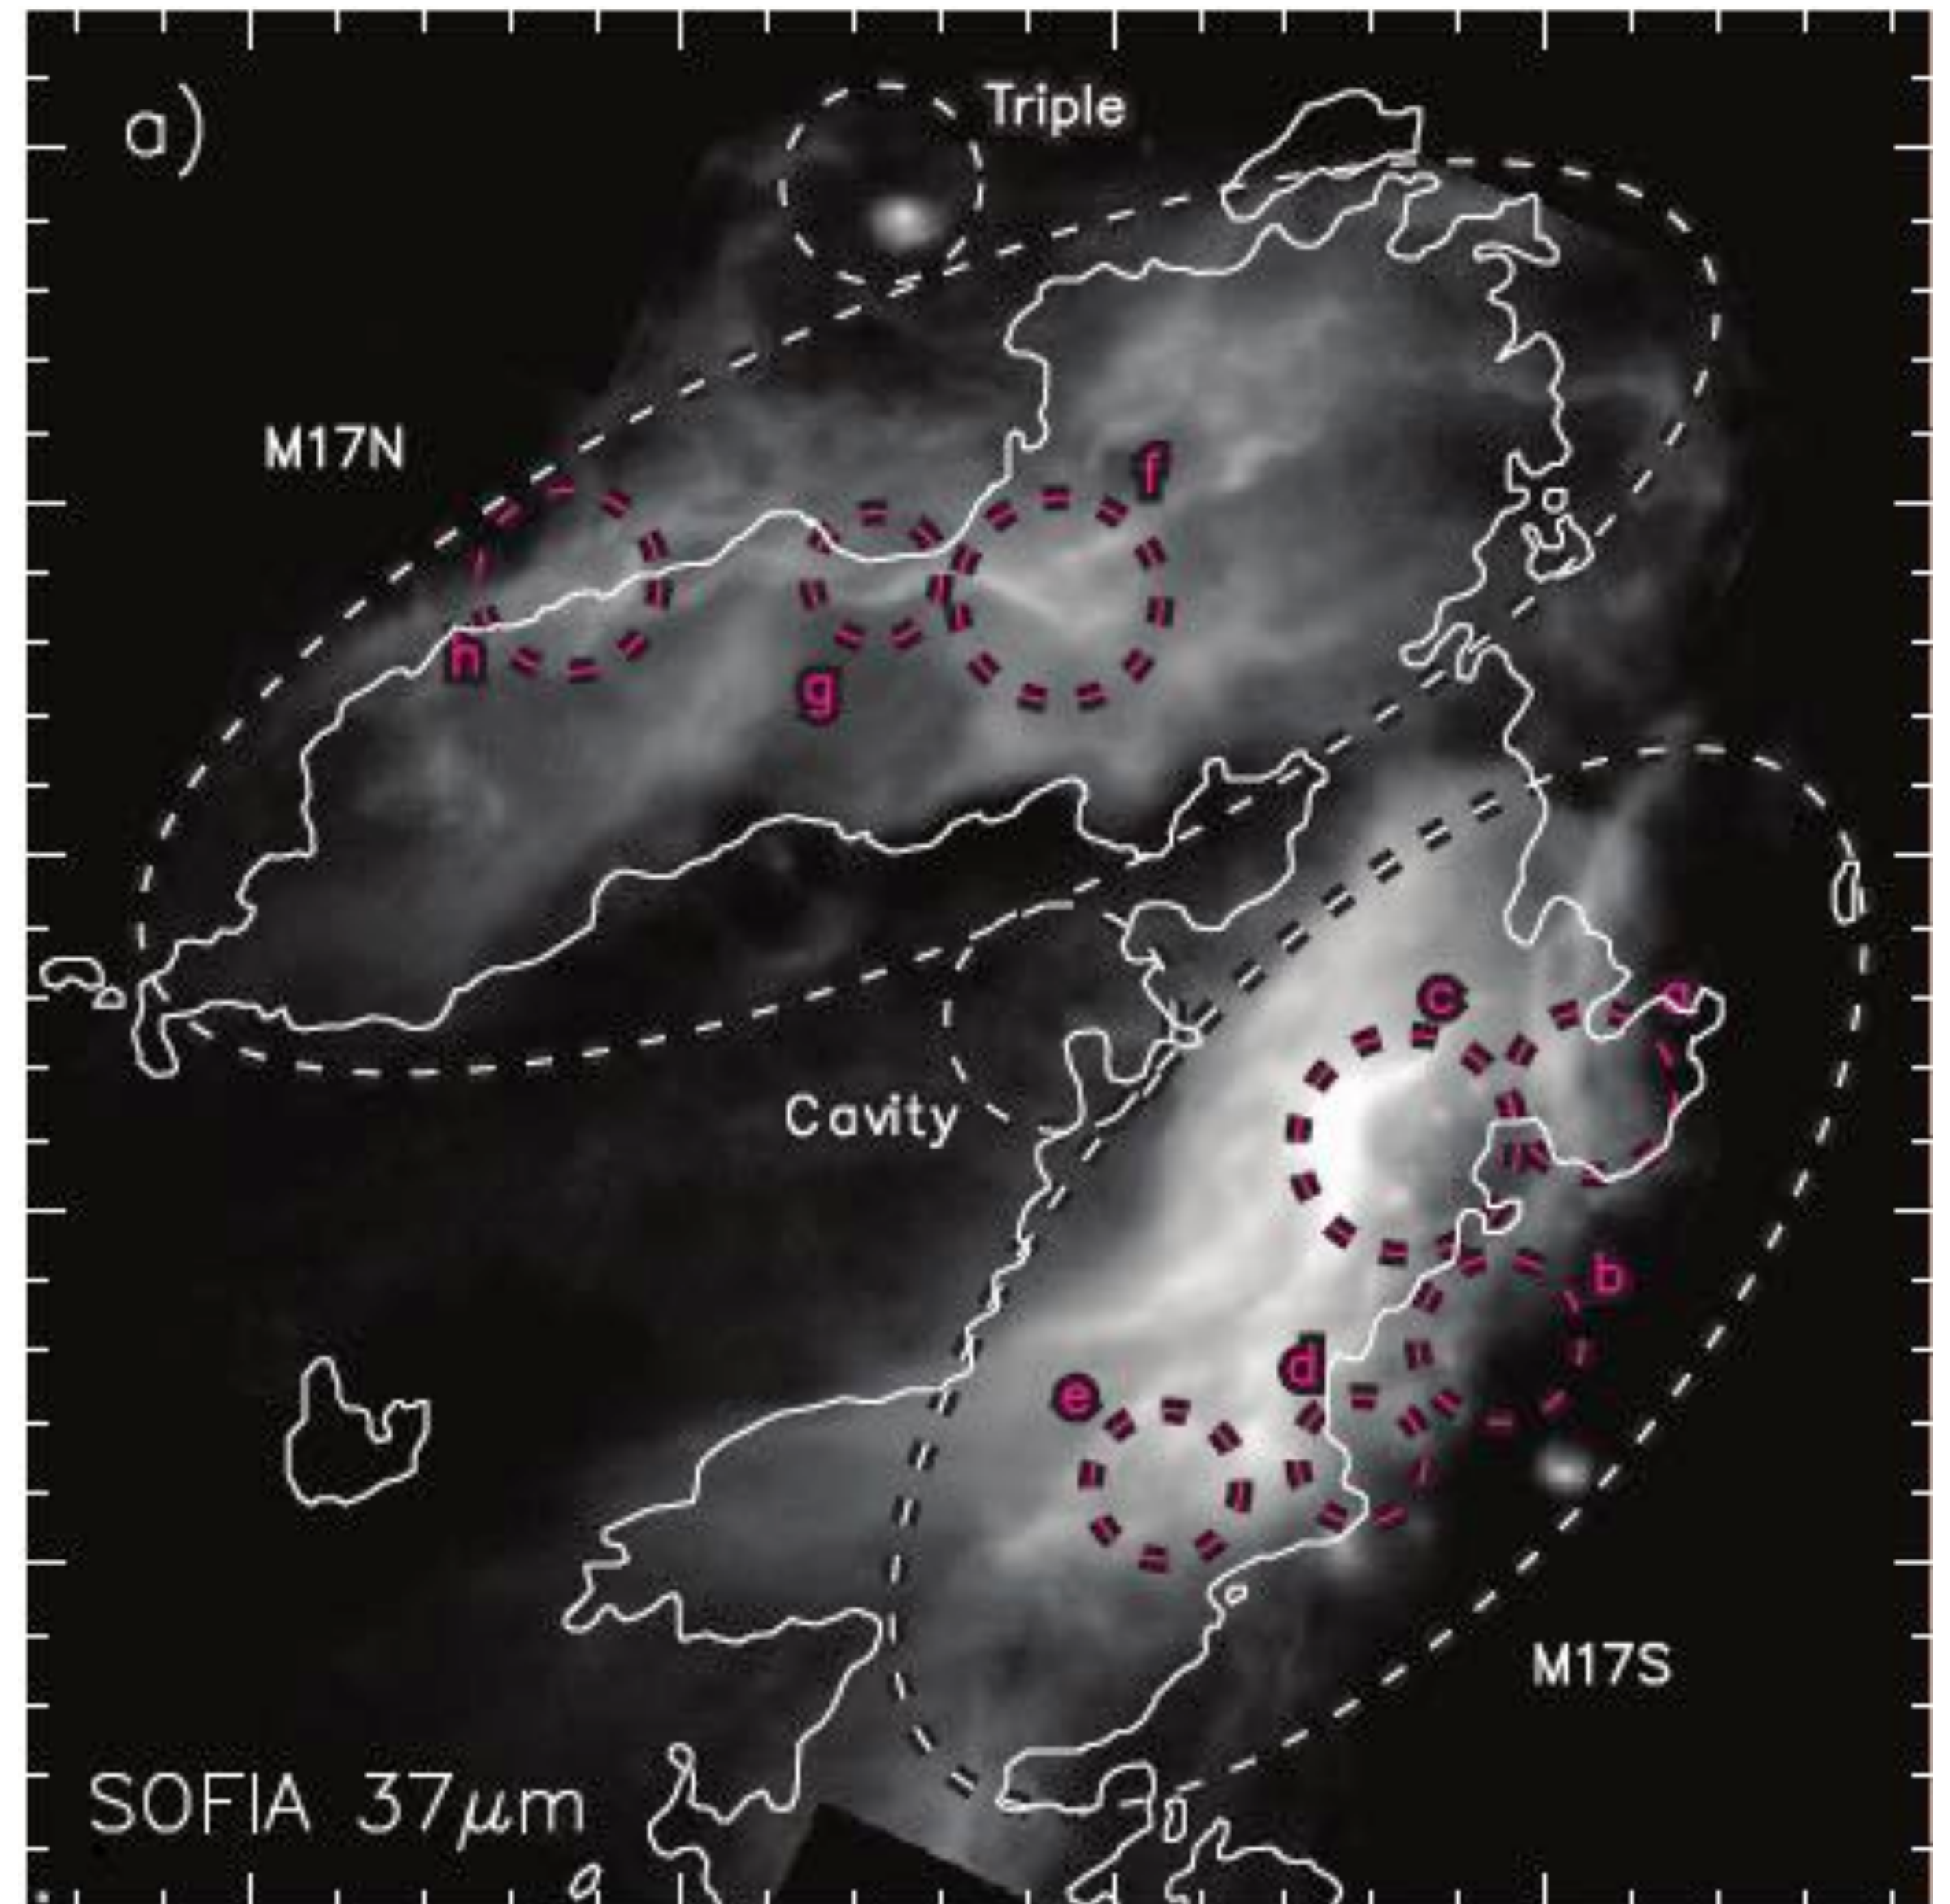

$L_{\text{bol}}/M_{\text{dust}}$

Higher L/M might indicate older clump due to more formed stars and less dust mass (used to make stars).

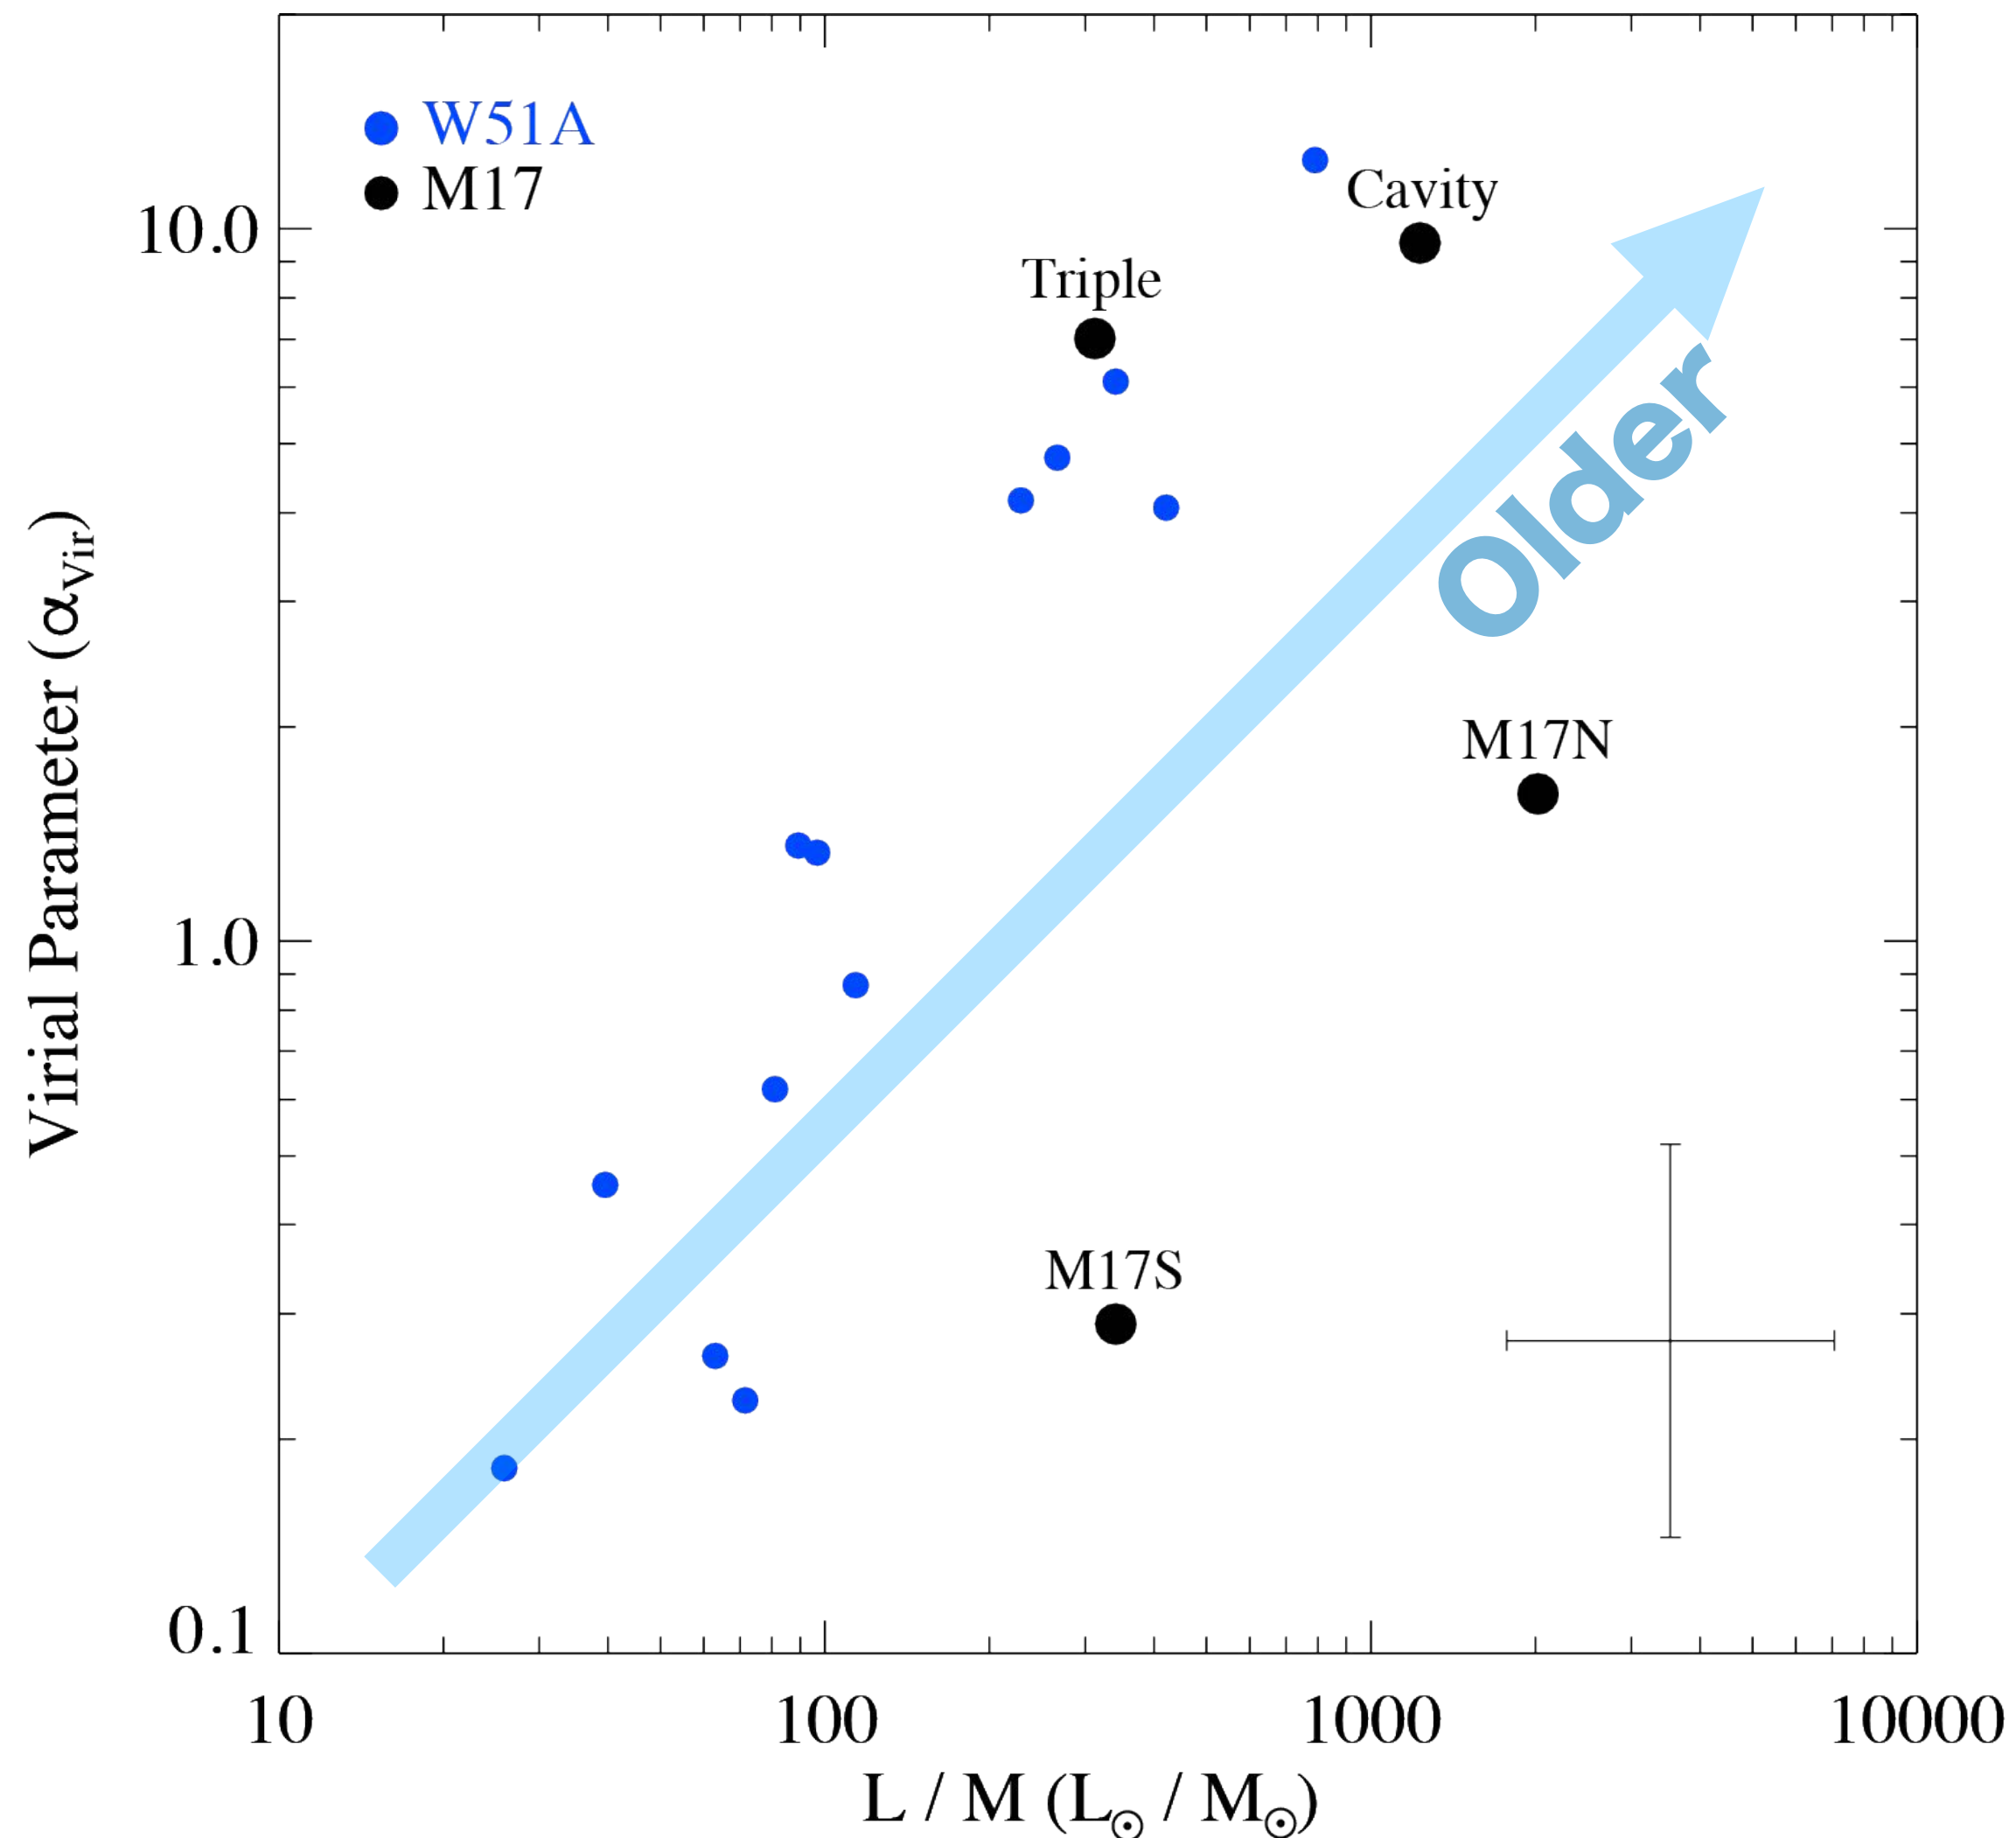

Proto-cluster Evolution

α_{vir} vs. L/M

Proto-cluster Evolution

α_{vir} vs. L/M

- As of W51A case, M17 also shows various evolutionary stages of proto-cluster thus structures in M17 are not coeval.
- The Cavity region is a massive stellar clusters (including NGC6618) and shows highest α_{vir} and L/M values.
- M17N seems to be older than M17S.
- Both M17N and M17S seem to be far from the main trend. We assume this is due to the PDR contamination.

Result 3.

We found possible $20\mu\text{m}$ contamination by [SIII] line.

20 μ m images contaminated by [SIII]

Lim et al 2020

Why so
serious?
different?

Blue - 20 μ m, Green - 37 μ m, Red - 70 μ m, White - 3.6 μ m

20 μ m images contaminated by [SIII]

Lim et al 2020

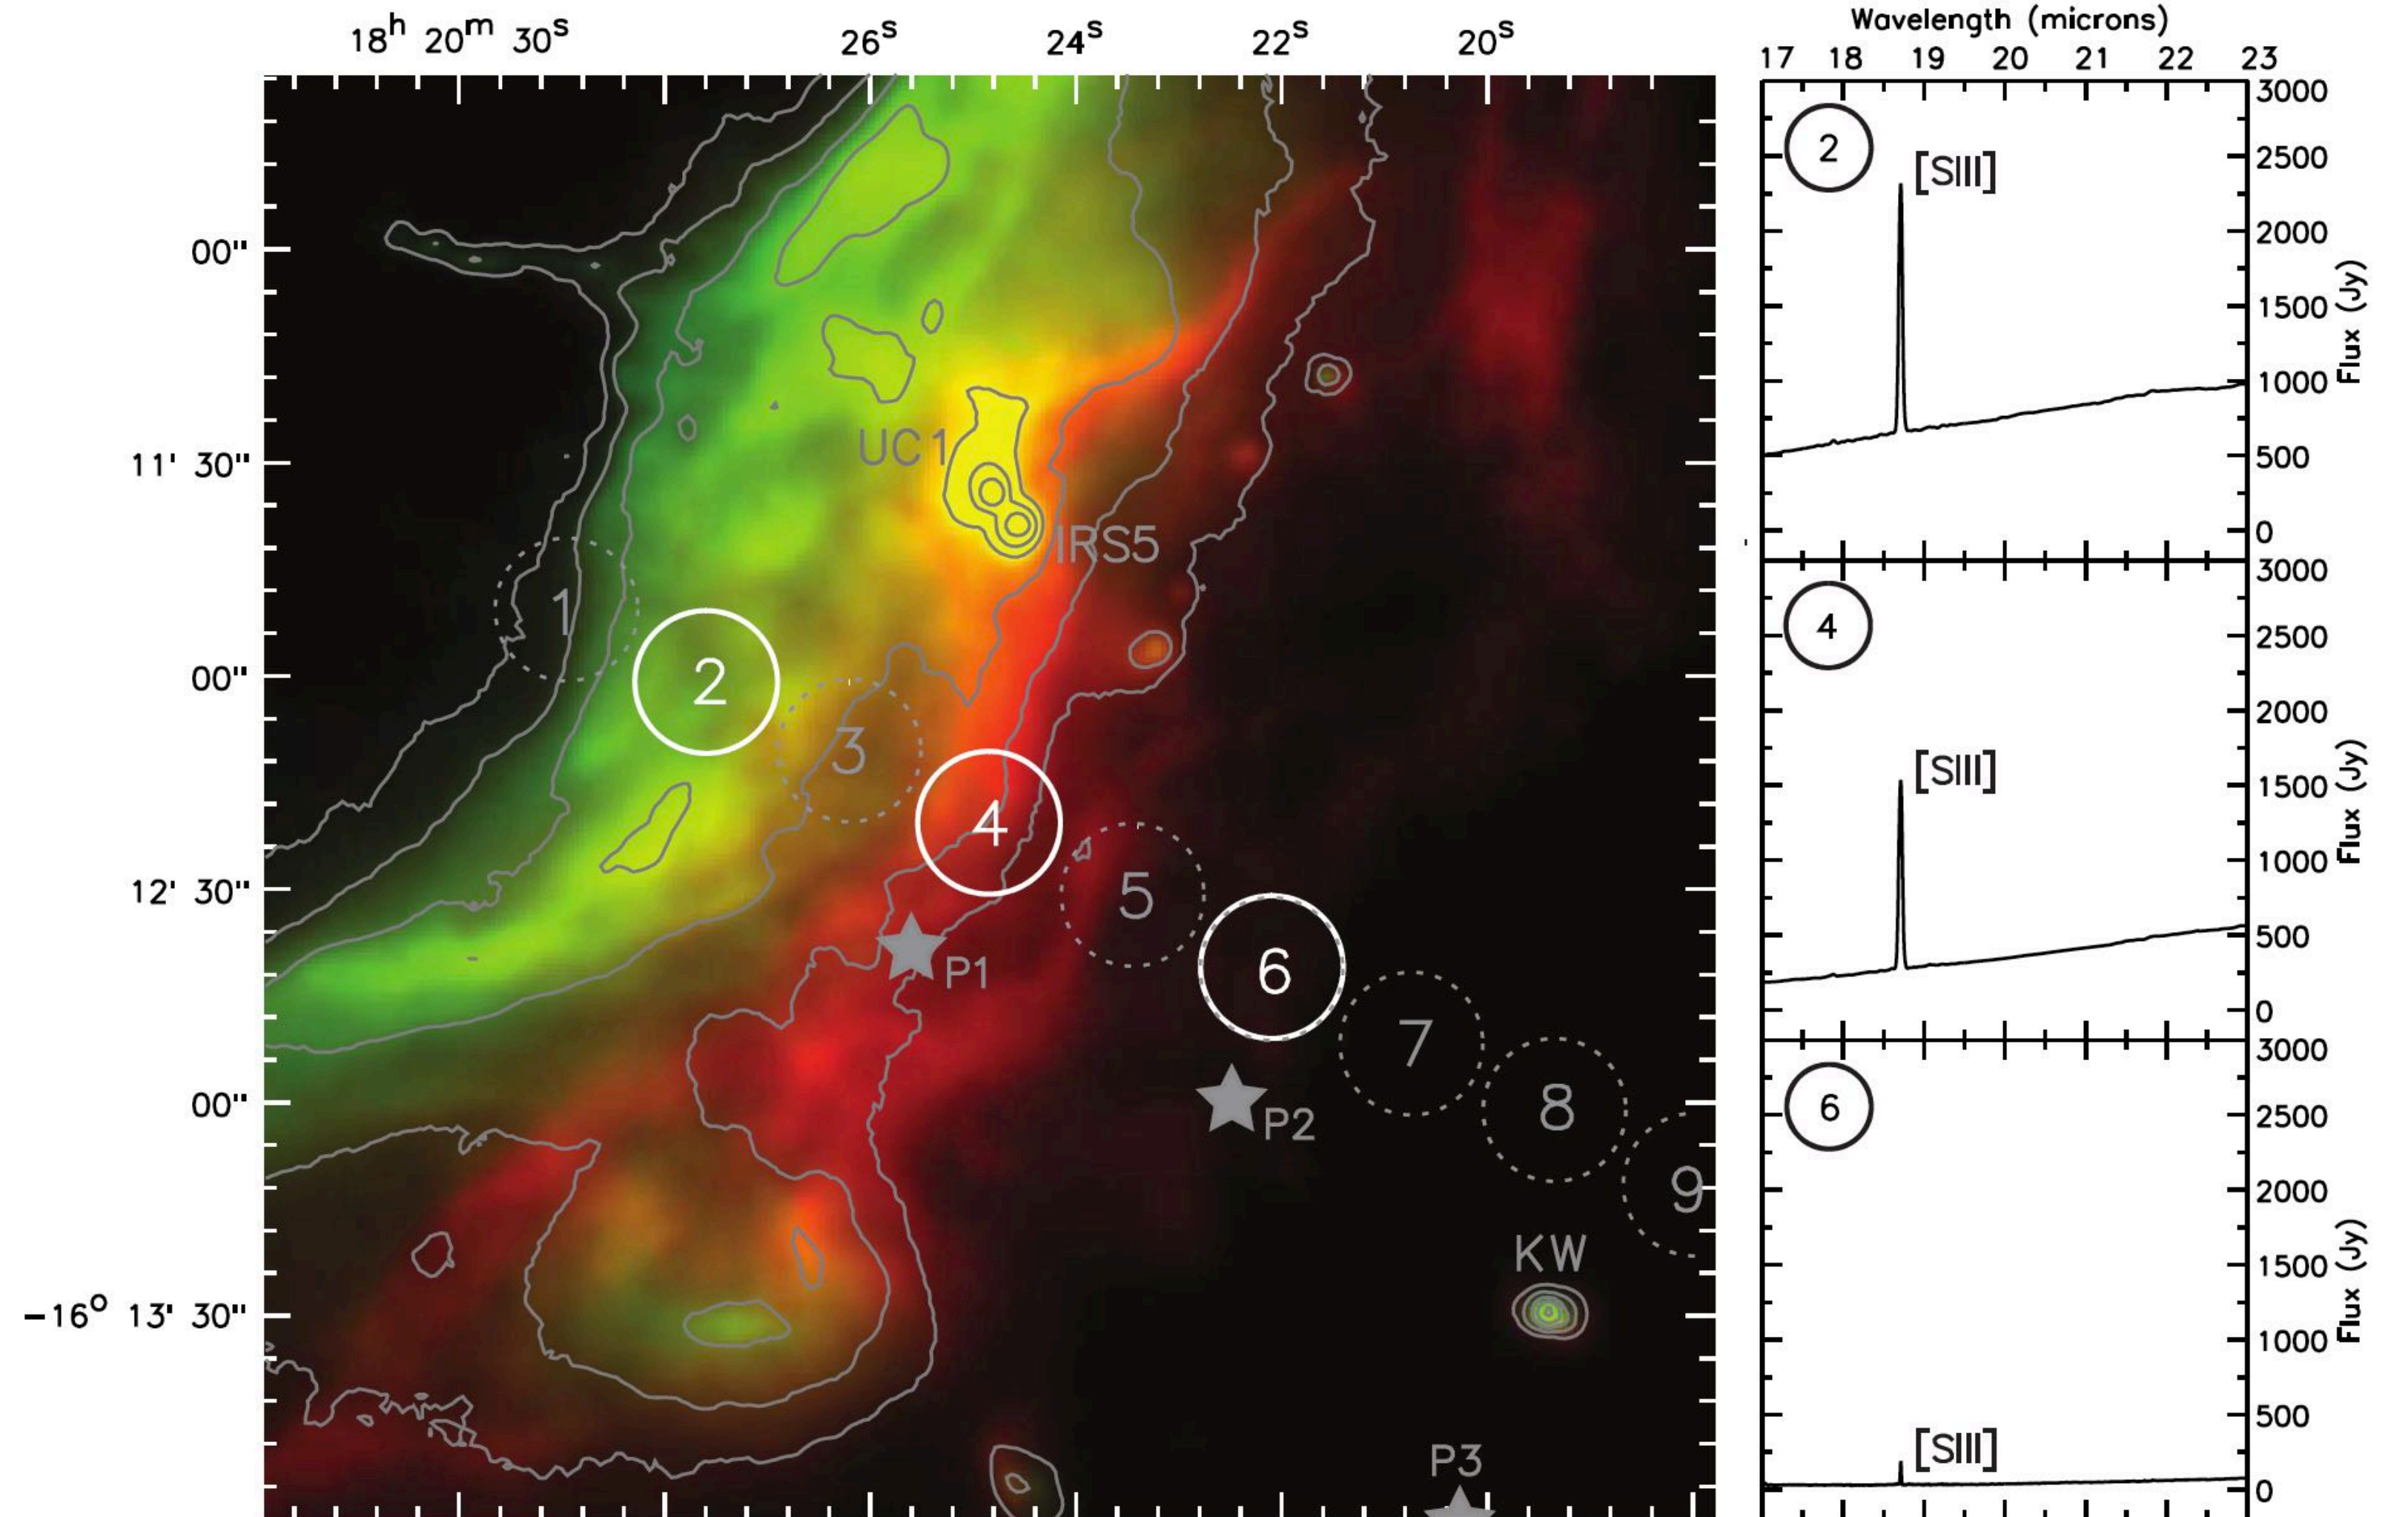

We have been fortunate
enough to find ISO observation
toward this region.

Blue - 20 μ m, Green - 37 μ m, Red - 70 μ m, White - 3.6 μ m

20 μ m images contaminated by [SIII]

Lim et al 2020

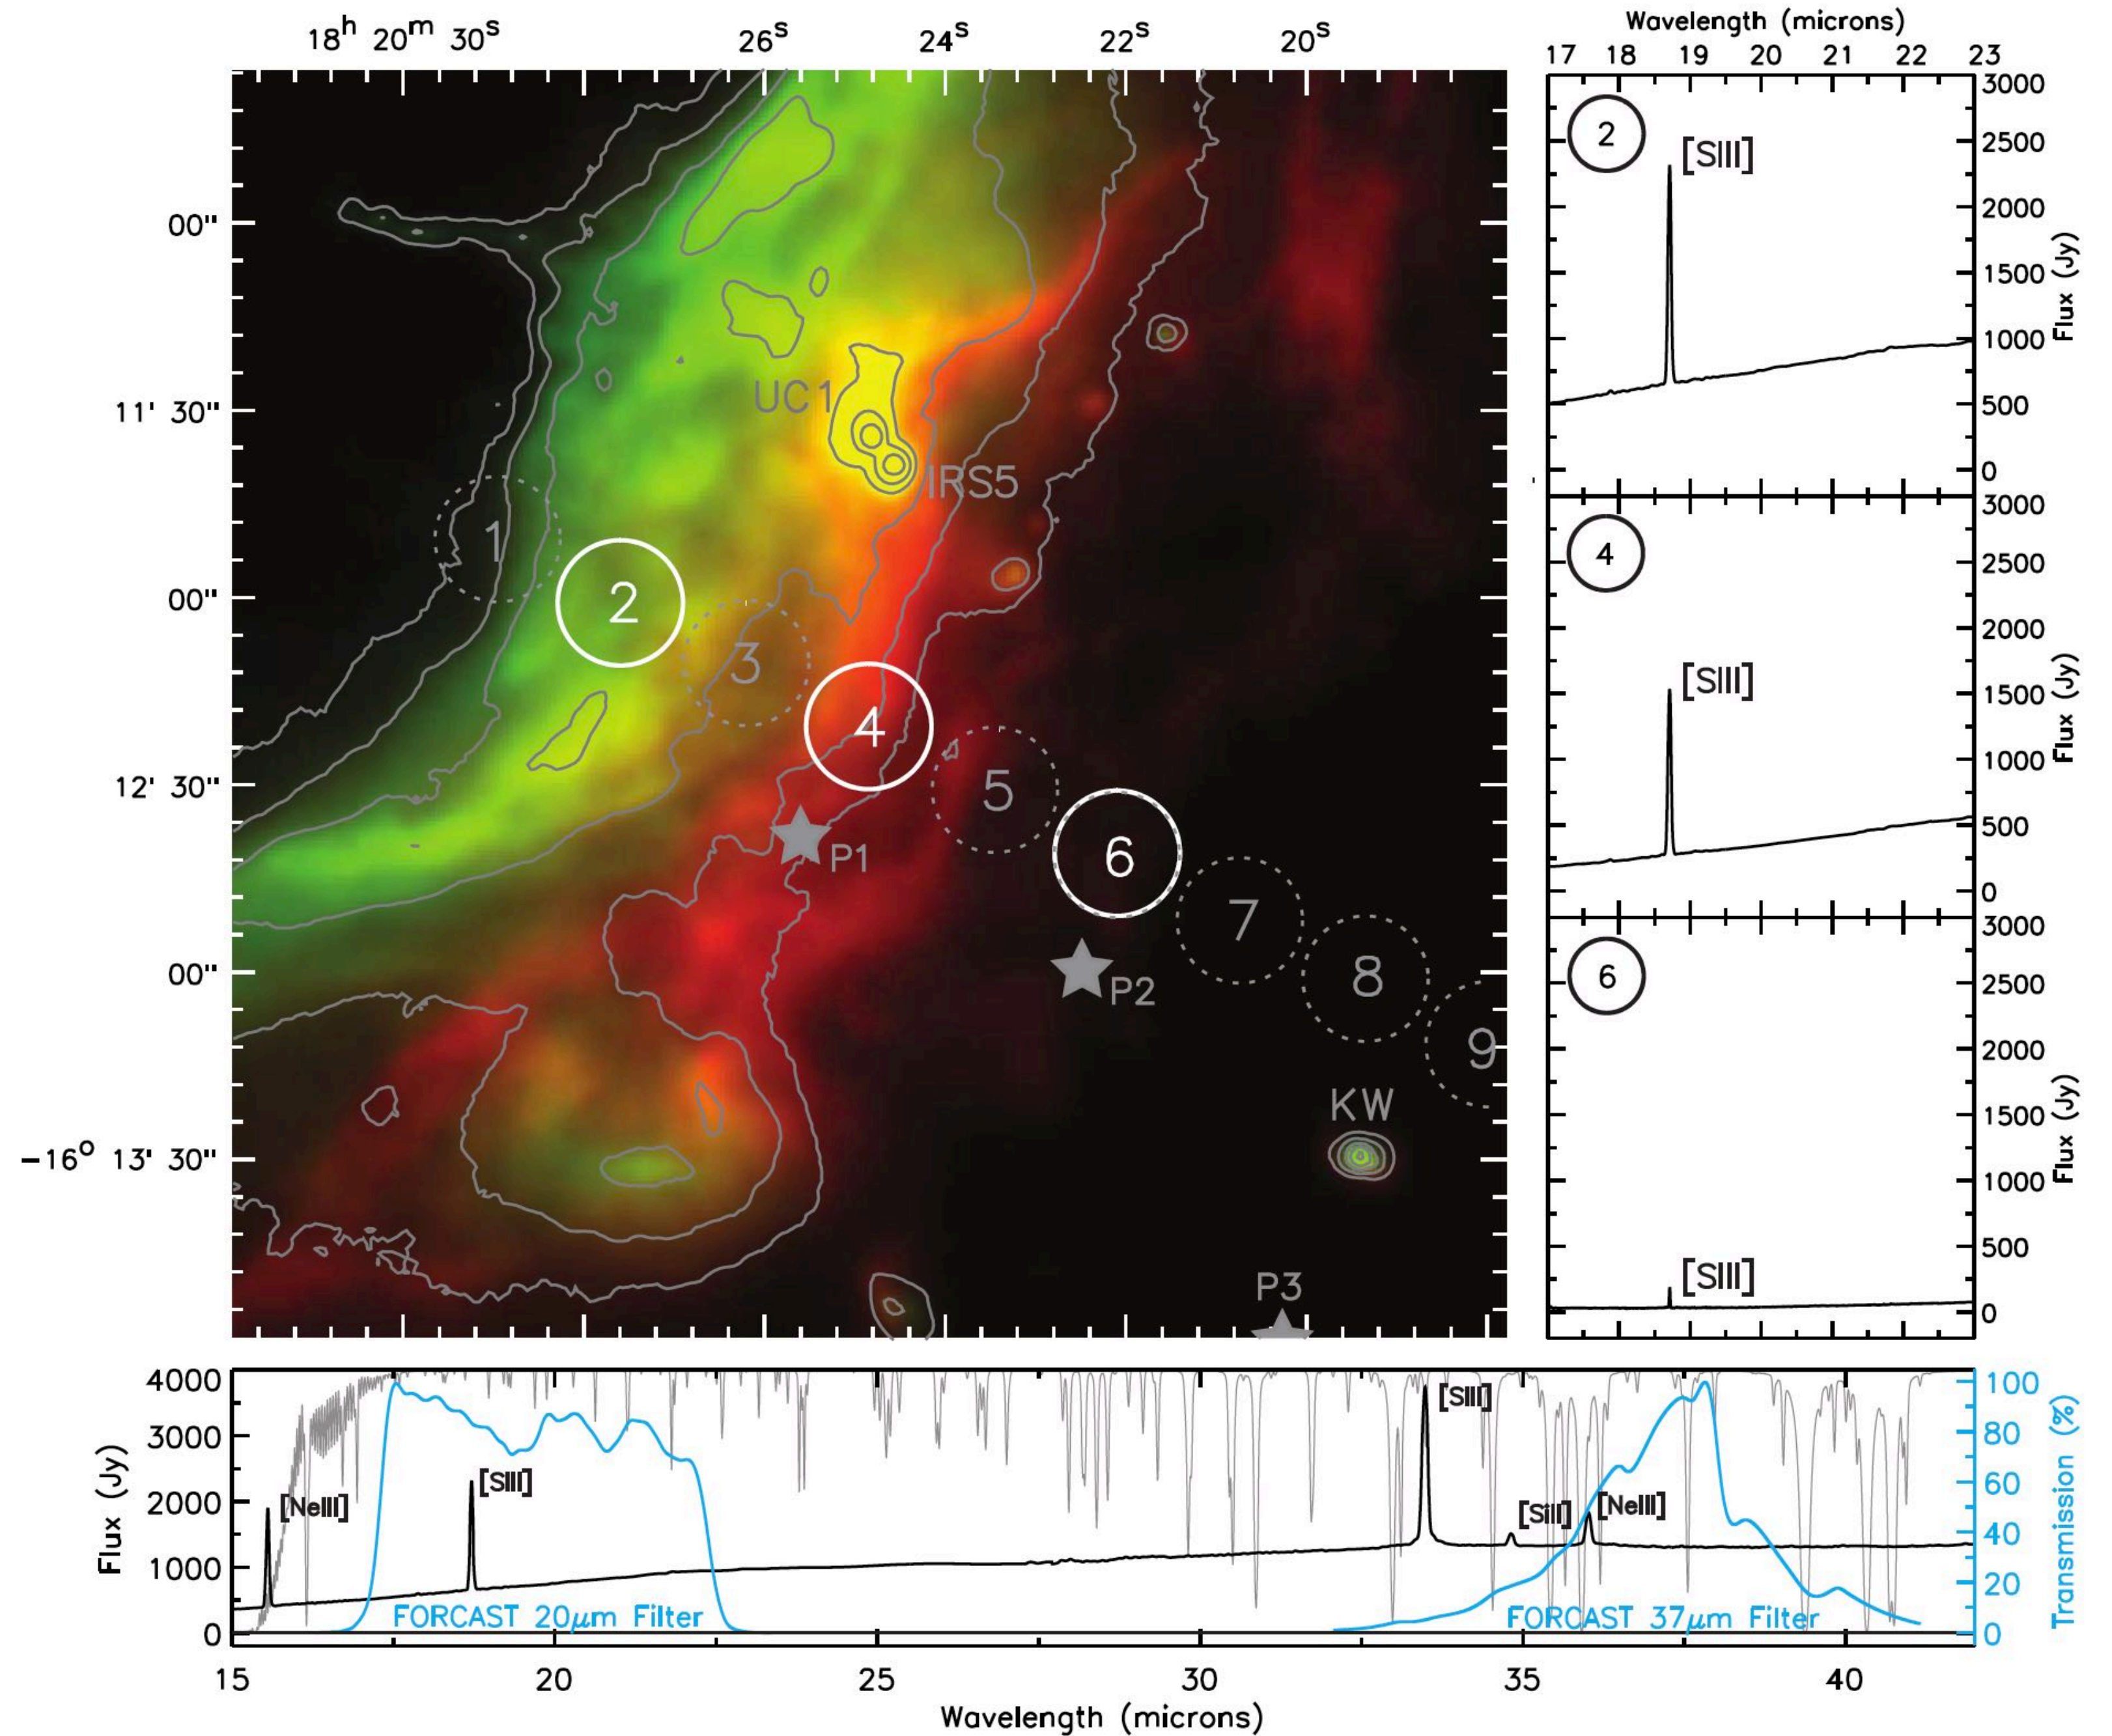

21

Green - 20 μ m, Red - 37 μ m

20 μ m images contaminated by [SIII]

- 20 μ m images are quite unique comparing to other wavelength regimes.
- The ISO archival data show the significant enhancement of the [SIII] line at PDR regions.
- 20 μ m imaging would be a good tracer for ionized regions of Galaxy.

Summary

- FORCAST 20 & 37 μ m imaging survey toward Galactic GHII regions is on-going and you now see the second results!
- The SOFIA data revealed a previously hidden population of MYSOs and gave us better understanding the physical nature of several already known sources.
- We find many MYSO candidates identified by other studies are not actually MYSOs.
- Independent evolutionary analyses show the structures in M17 are not coeval.
- FORCAST 20 μ m imaging is possibly a good tracer for ionized regions ([SIII] line).

Appetizing another study

Star Cluster Formation in Orion A

(Investigating how cloud-cloud collision important as a massive star cluster forming mechanism.)

CARMA-NRO Orion survey

(Kong ea 2018)

- angular resolution $\sim 5''$.
- The closest separation among YSOs in IN-SYNC project is $\sim 6''$
- We now can compare the velocity difference and gas column density to the properties of individual YSOs!

$^{13}\text{CO}(1-0)$ vs. YSO

Location of Star clusters

(Lim ea 2020 PASJ)

Result I. v_{CO} vs. v_{YSO} of Orion A cloud

- Older YSOs have gotten less associated with the dense gas structure.
- Supporting Cloud-Cloud Collision scenario?

Simulations are based on Wu et al. 2017

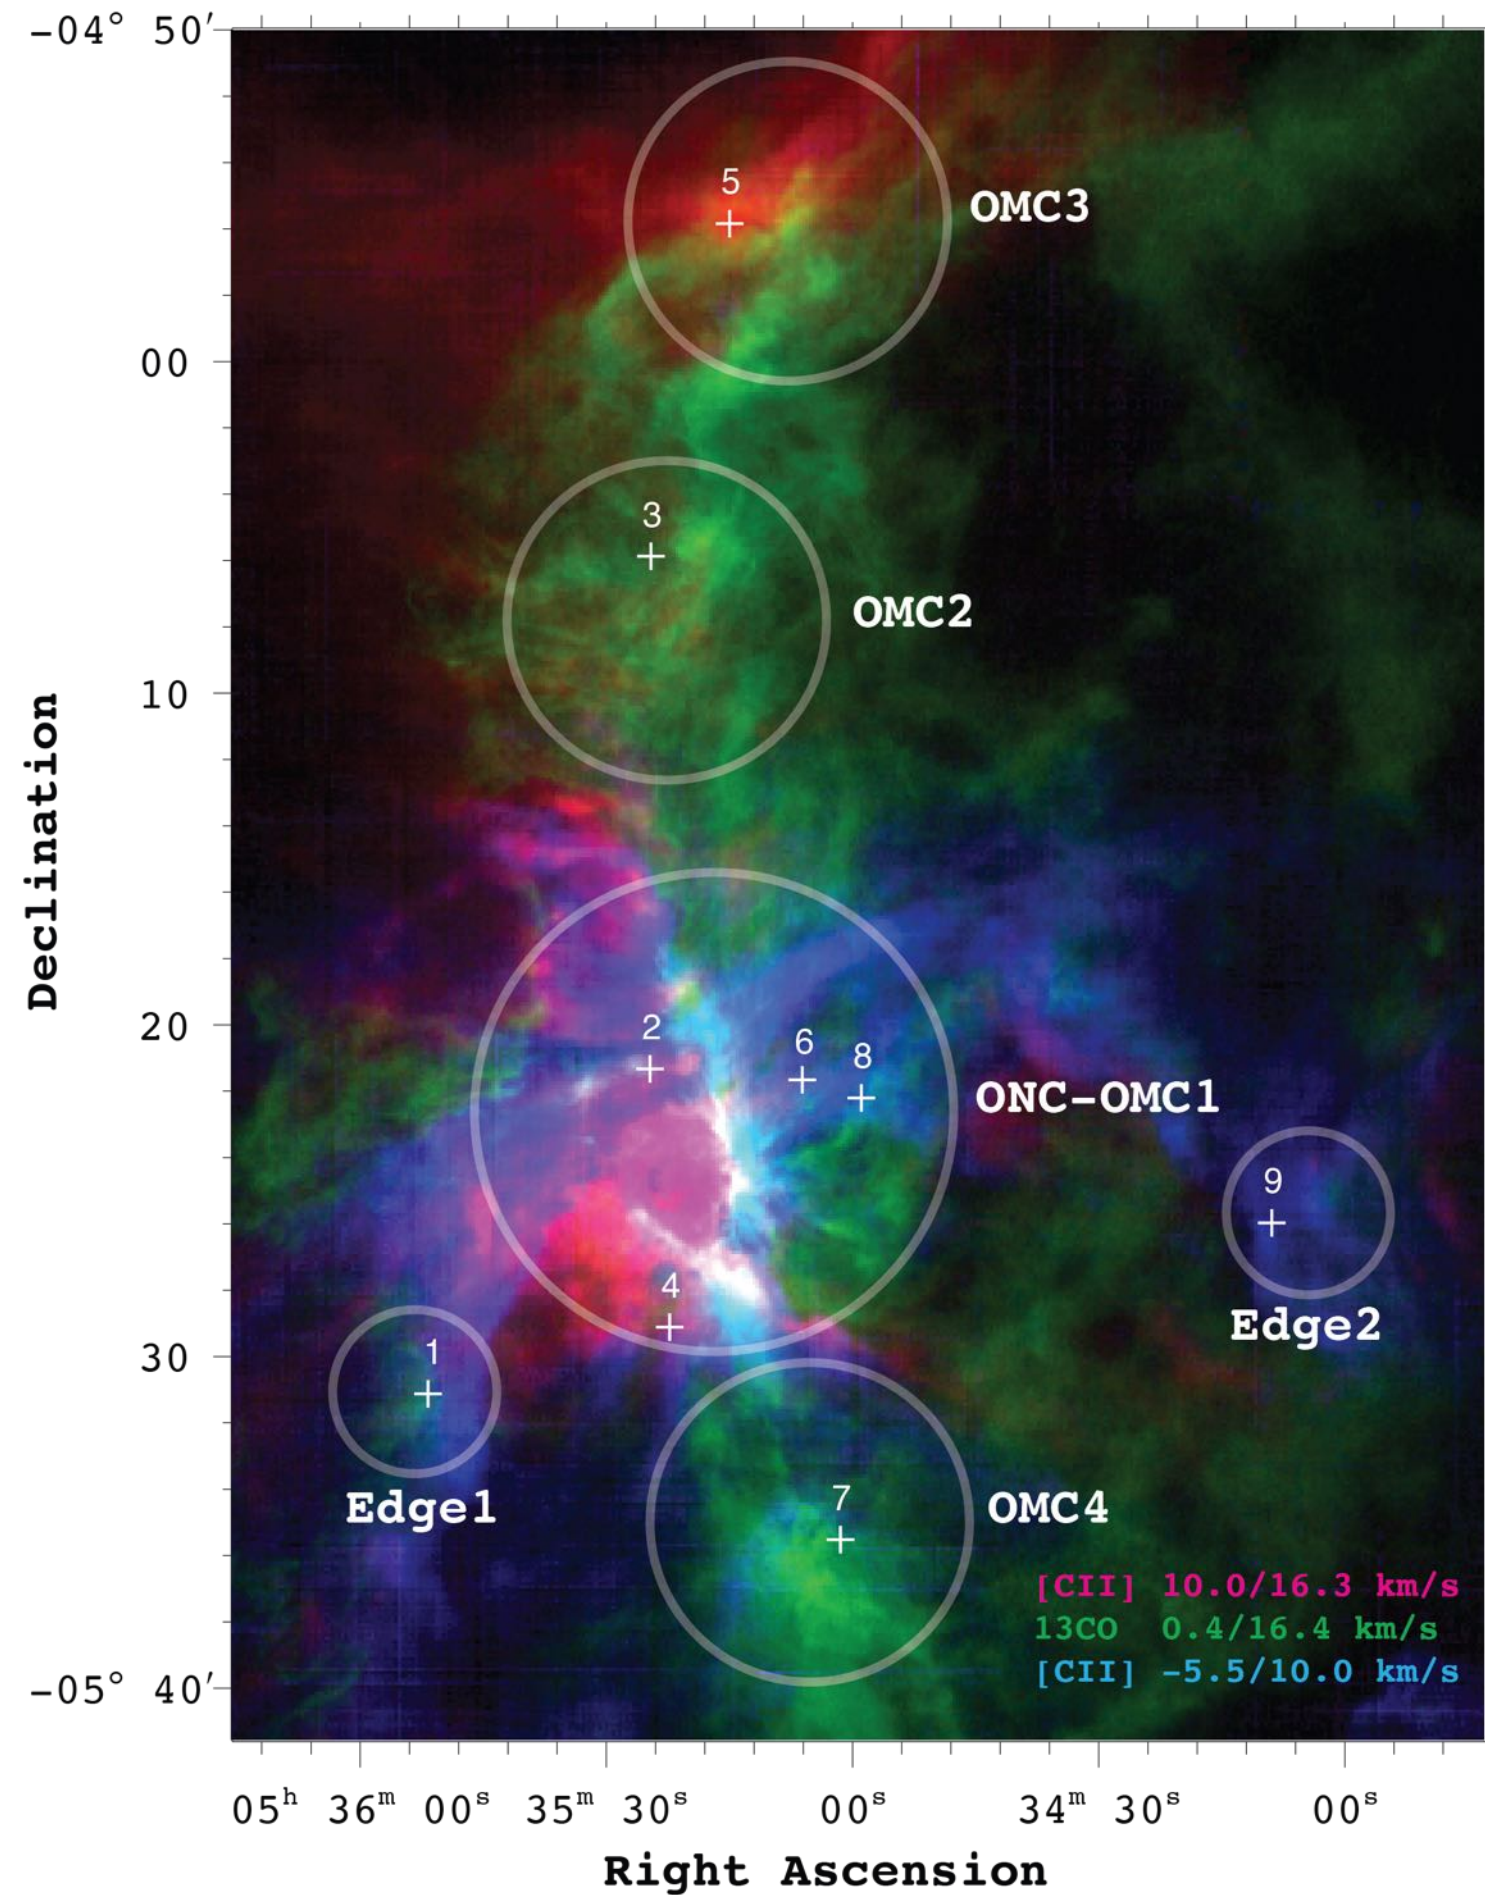

Result 2. v_{co} vs. v_{YSO} of Star Clusters

- ONC-OMC1, OMC4 and L1641N clusters seem to qualitatively agree with Cloud-Cloud Collision scenario.
- OMC2 and OMC3 do not agree with either scenarios while NGC1999 favors non-colliding.

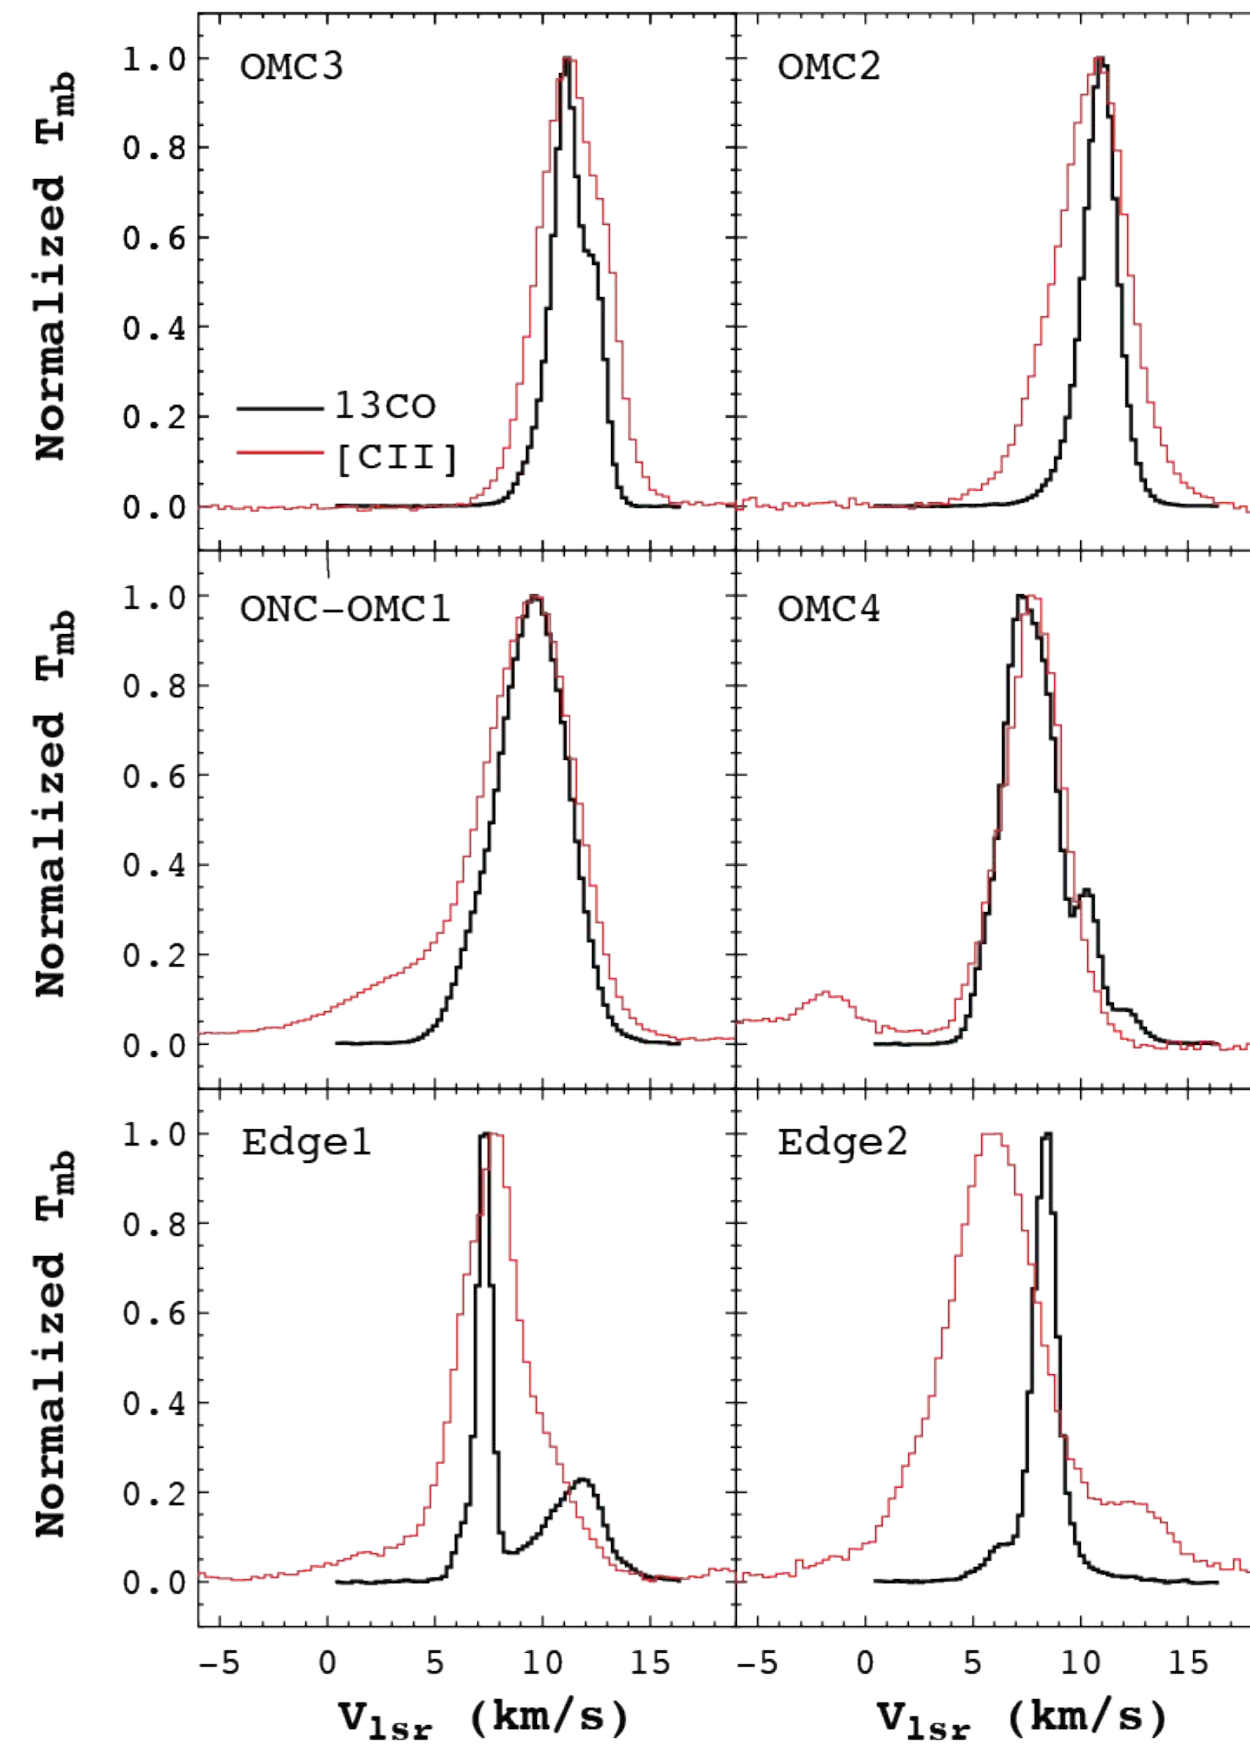

Result 3. ^{13}CO vs. $[\text{CII}]$

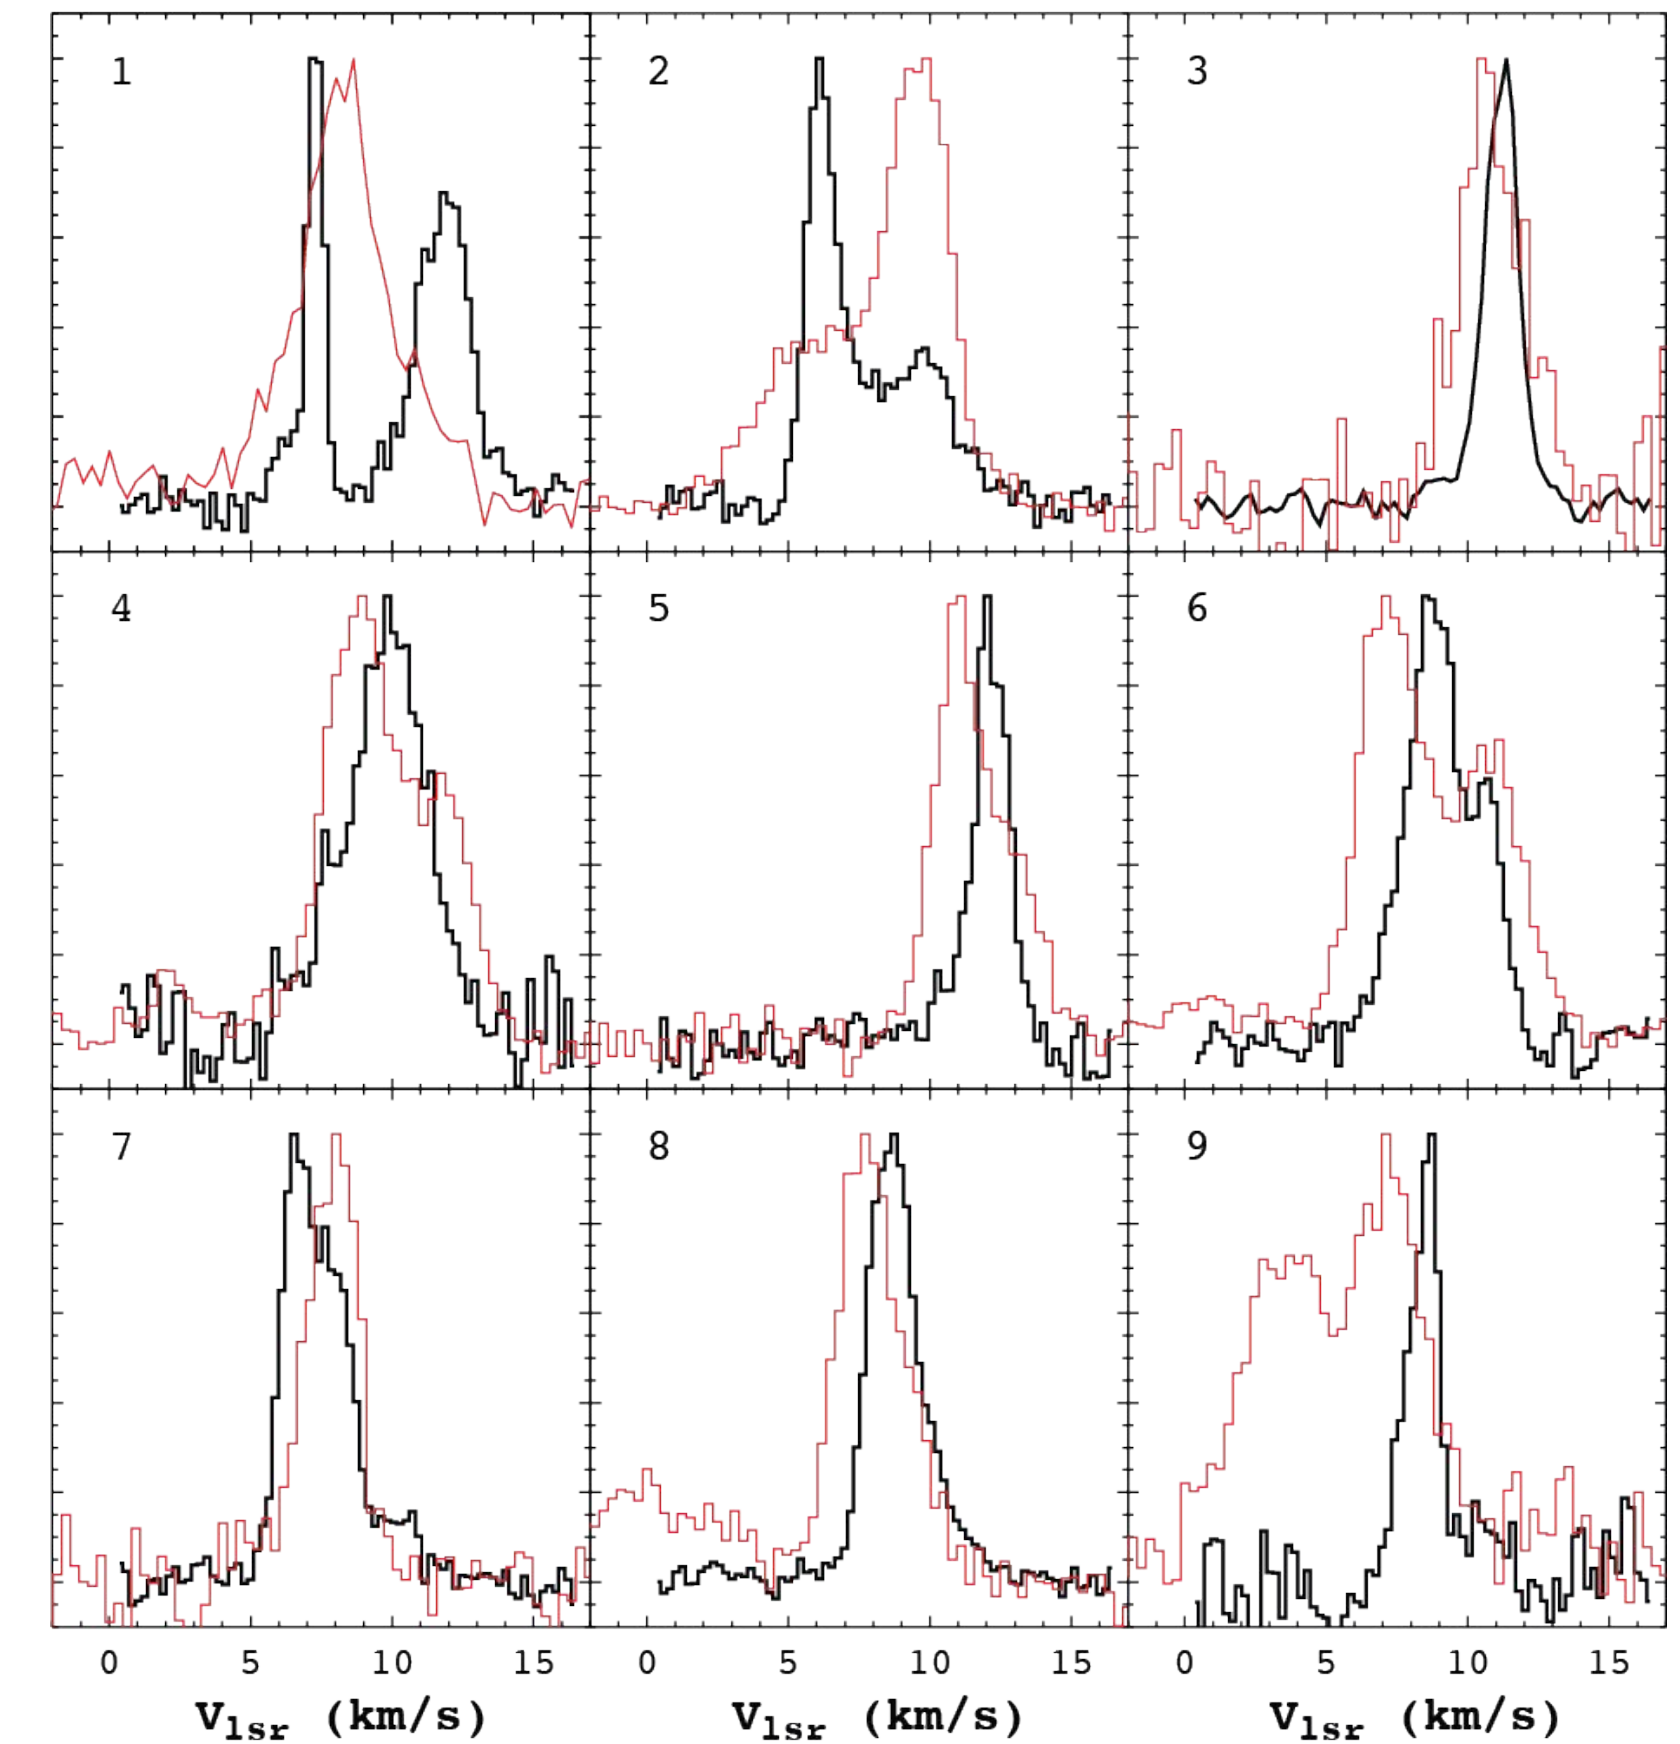

- ^{13}CO and $[\text{CII}]$ show spatial and velocity offsets at several locations (local, i.e. individual pixels).
- Supporting Cloud-Cloud Collision scenario?

Integrated $T_{\text{mb}, [\text{CII}]}$ vs. $T_{\text{mb}, ^{13}\text{CO}}$

$T_{\text{mb}, [\text{CII}]}$ vs. $T_{\text{mb}, ^{13}\text{CO}}$ of individual pixels

Additional Summary

- We utilized three independent survey data to Orion A cloud to trace the history of star cluster formation, especially tested cloud-cloud collision scenario.
- The ^{13}CO vs. YSO analysis shows the older YSO the less the kinematic association between dense gas structure.
- The individual star clusters may favor cloud-cloud collision, especially at the northern part of Orion A.
- The ^{13}CO vs. [CII] of northern part of Orion A shows also slight favoring of cloud-cloud collision scenario.
- Further observational analyses with more complete simulations would confirm or refute the cloud-cloud collision as an important mechanism for star cluster formation in Orion A cloud.
